4. NAICS DESCRIPTION AND CODE:

NAICS Description: Hazardous Waste Treatment and Disposal  
NAICS Code: 562211

5. ALL SUBMITTALS:

The following is a list of ALL permit applications included in this permit revision.

Date of Application	Type of Application (New, Renewal, Modification, Deminimis/Minor Mod, or Administrative Amendment)	Short Description of Any Changes That Would Be Considered New or Modified Emissions
1/26/2023	Minor Mod	N/A
2/10/2023	Administrative Amendment	N/A

6. REVIEWER'S NOTES:

This permitting action is necessary to remove the requirement to run the De-NO<sub>x</sub> unit at all times (previous Specific Condition #173) while the SN-44 incinerator is in operation. The facility often incinerates low nitrogen wastes which produce significantly less NO<sub>x</sub> in the stack gases than high nitrogen wastes. In such situations, the facility does not need to run De-NO<sub>x</sub> unit to achieve compliance with the NO<sub>x</sub> emission limit listed in Specific Condition #160. The facility already shows compliance with Specific Condition #160 NO<sub>x</sub> limit by operating a CEMS, required by Specific Condition #172. In addition, the

facility is adding two electric heaters and fans in Pellet Silos #1 and #2 as A-13 Insignificant Activities. Permitted emissions are unchanged.

7. COMPLIANCE STATUS:

The following summarizes the current compliance of the facility including active/pending enforcement actions and recent compliance activities and issues.

There are no active or pending enforcement actions.

8. PSD/GHG APPLICABILITY:

a) Did the facility undergo PSD review in this permit (i.e., BACT, Modeling, etc.)? N  
If yes, were GHG emission increases significant? N

b) Is the facility categorized as a major source for PSD? Y

- *Single pollutant ≥ 100 tpy and on the list of 28 or single pollutant ≥ 250 tpy and not on list*

If yes for 8(b), explain why this permit modification is not PSD.

There are no emission increases associated with this change

14. AMBIENT AIR EVALUATIONS:

The following are results for ambient air evaluations or modeling.

a) NAAQS

A NAAQS evaluation is not required under the Arkansas State Implementation Plan, National Ambient Air Quality Standards, Infrastructure SIPs and NAAQS SIP per Ark. Code Ann. § 8-4-318, dated March 2017 and the DEQ Air Permit Screening Modeling Instructions.

b) Non-Criteria Pollutants:

The facility emits HAPs related to incomplete combustion, waste incineration and handling, storage tanks and solvent recovery.

This permit does not contain a TLV table for organic HAPs since the Hazardous Waste Multipathway Risk Assessment dated November 16, 2012 included the evaluation of organic HAPs for all sources.

1<sup>st</sup> Tier Screening (PAER)

Estimated hourly emissions from the following sources were compared to the Presumptively Acceptable Emission Rate (PAER) for each compound. The Division of Environmental Quality has deemed the PAER to be the product, in lb/hr, of 0.11 and the Threshold Limit Value (mg/m<sup>3</sup>), as listed by the American Conference of Governmental Industrial Hygienists (ACGIH).

No modeling was performed for this revision, 1009-AOP-R26.

### 2<sup>nd</sup> Tier Screening (PAIL)

AERMOD air dispersion modeling was performed on the estimated hourly emissions from the following sources, in order to predict ambient concentrations beyond the property boundary. The Presumptively Acceptable Impact Level (PAIL) for each compound has been deemed by the Division of Environmental Quality to be one one-hundredth of the Threshold Limit Value as listed by the ACGIH.

SN-24 Emergency Equipment is not modeled per ADEQ guidance. Modeling was only performed on pollutants that had a change in emissions for R22 which includes SN-50 and SN-51 which replaced SN-34. All other modeling results were from the R11, R17 or R21 version of the permit.

<sup>a</sup> TLV for manganese and inorganic compounds as manganese. Manganese cyclopentadienyl tricarbonyl has a lower TLV, however, since this compound is organic it would be emitted at a lower rate and pass the strategy.

\* The vapor pressure of Hydrazine is 0.31 psi which is very low. In addition, the facility receives Hydrazine as a mixture of waste. Therefore, in the past permit application/renewal (R17), it is assumed that negligible amounts of fugitive emissions occur during material handling and modeled for incinerator emissions only using very conservative assumptions. The highest amount of Hydrazine received in the past (51,000 lb/yr = 1.02 lb/hr) which includes fugitives which also should account for SN-49 and SN-52 emissions.

Alternate modeling was performed for beryllium for R22 and hydrazine for R17. The results are summarized in the following Table:

Pollutant	Highest Modeling Result ( $\mu\text{g}/\text{m}^3$ )	OEHHA – Chronic REL ( $\mu\text{g}/\text{m}^3$ )	Averaging Period	Pass?
Beryllium	0.00034	0.007	Annual	Pass
Hydrazine	0.086*	0.2	Annual	Pass

\* Based on highest product received in past (51,000 lb/yr = 1.02 lb/hr); includes fugitives

REL = Reference Exposure Level

OEHHA = California Office of Environmental Health Hazard Assessment

Air quality standards established by the California Office of Environmental Health Hazard Assessment (OEHHA) were used to evaluate the modeling results. Said agency has promulgated a Chronic REL for the target pollutant.

ADEQ has accepted the use of OEHHA values as alternate air quality criteria in previous permitting actions for other Arkansas industrial facilities. The Air Division has determined that if the ambient air concentrations of a given HAP are less than 100% of the Chronic REL, then the emissions are acceptable from an air quality standpoint.

c) H<sub>2</sub>S Modeling:

A.C.A. §8-3-103 requires hydrogen sulfide emissions to meet specific ambient standards. Many sources are exempt from this regulation, refer to the Arkansas Code for details.

Is the facility exempt from the H<sub>2</sub>S Standards N

Pollutant	Threshold value	Modeled Concentration (ppb)	Pass?
H <sub>2</sub> S	20 parts per million (5-minute average*)	10.2321 ppb or 0.0102 ppm	Y
	80 parts per billion (8-hour average) residential area	2.183 µg/m <sup>3</sup> = 1.566 ppb	Y
	100 parts per billion (8-hour average) nonresidential area	2.183 µg/m <sup>3</sup> = 1.566 ppb	Y

\*To determine the 5-minute average use the following equation

$$C_p = C_m (t_m/t_p)^{0.2} \text{ where}$$

C<sub>p</sub> = 5-minute average concentration

C<sub>m</sub> = 1-hour average concentration

t<sub>m</sub> = 60 minutes

t<sub>p</sub> = 5 minutes

20. DELETED CONDITIONS:

Former SC	Justification for removal
#173	The facility often incinerates low nitrogen wastes which produce significantly less NO <sub>x</sub> in the stack gases than high nitrogen wastes. In such situations, the facility does not need to run De-NO <sub>x</sub> unit to achieve compliance with the NO <sub>x</sub> emission limit listed in Specific Condition #160. The facility already shows compliance with Specific Condition #160 NO <sub>x</sub> limit by operating a CEMS,

Former SC	Justification for removal
