- Chronic static renewal 7-day larval survival and growth test using fathead minnows (*Pimephales promelas*) (Method 1000.0).

3. Plant Location

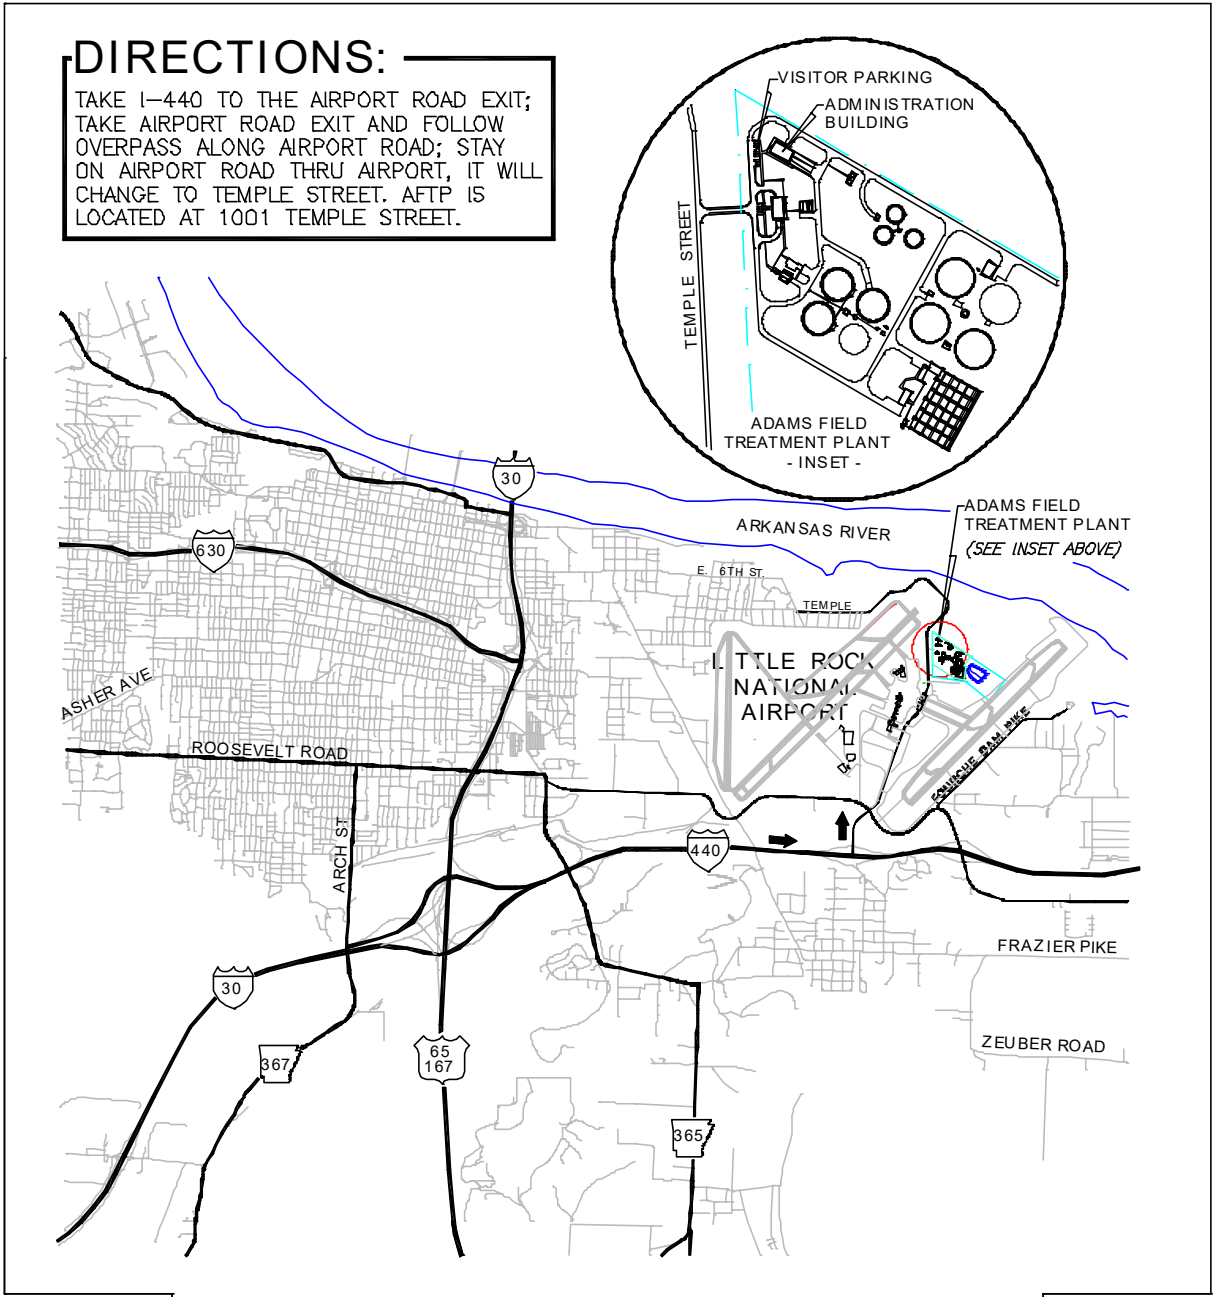

The Adams facility is located at 1001 Temple Street in Little Rock which is on the southwest side of the Arkansas River just east of Little Rock's Adams Field Municipal Airport. (See page 2 for vicinity map location.)

SECTION II PLANT OPERATIONS

1. Product(s)

Treated effluent from a publicly owned treatment works that receives municipal sewage.

2. Raw Materials

Raw sewage sources are mainly domestic from household waste, pretreated industrial waste with some contributions from commercial sources.

3. Operating Schedule

The Water Reclamation Facility receives and subsequently discharges flow at a continuous rate. The Water Reclamation Facility is staffed twenty-four hours a day by one operator or shift supervisor. During the day shift, Monday - Friday, one extra relief crew is on duty as well as the Facility Superintendent.

4. Description of Waste Treatment

Preliminary Treatment. All incoming municipal sewage enters a screen chamber with 3/8 inch openings for screening followed by flow measurement.

Primary Treatment. All Flow from the preliminary treatment units is treated in the primary clarifiers. Primary Treatment includes grit and scum removal which returns to the preliminary treatment building for disposal.

Secondary Treatments. The treatment works has a complete-mix activated sludge process for secondary treatment.

Disinfection. The final effluent is UV disinfected prior to discharge to the Arkansas River.

Solids Handling and Disposal. The main sources of solids are: 1) primary sludge, and 2) waste activated sludge. The waste activated and primary sludges are transferred to the Fourche Creek Water Reclamation Facility. All sludges are processed in gravity sludge thickeners or a gravity belt thickener prior to transfer to anaerobic digesters. The digested sludge is pumped to biosolids, storage lagoons and ultimately disposed of through approved land application methods.

5. Schematic of Waste Treatment

See page 5 for plant schematics.

6. Retention Time (If Applicable)

Retention times at design flow:

Primary Treatment	2 hours
Activated Sludge Process	6 hours
A.S.P. Final Tanks.....	2 hours
UV Disinfection	Instantaneous
PAA Supplemental Disinfection	7.2 min

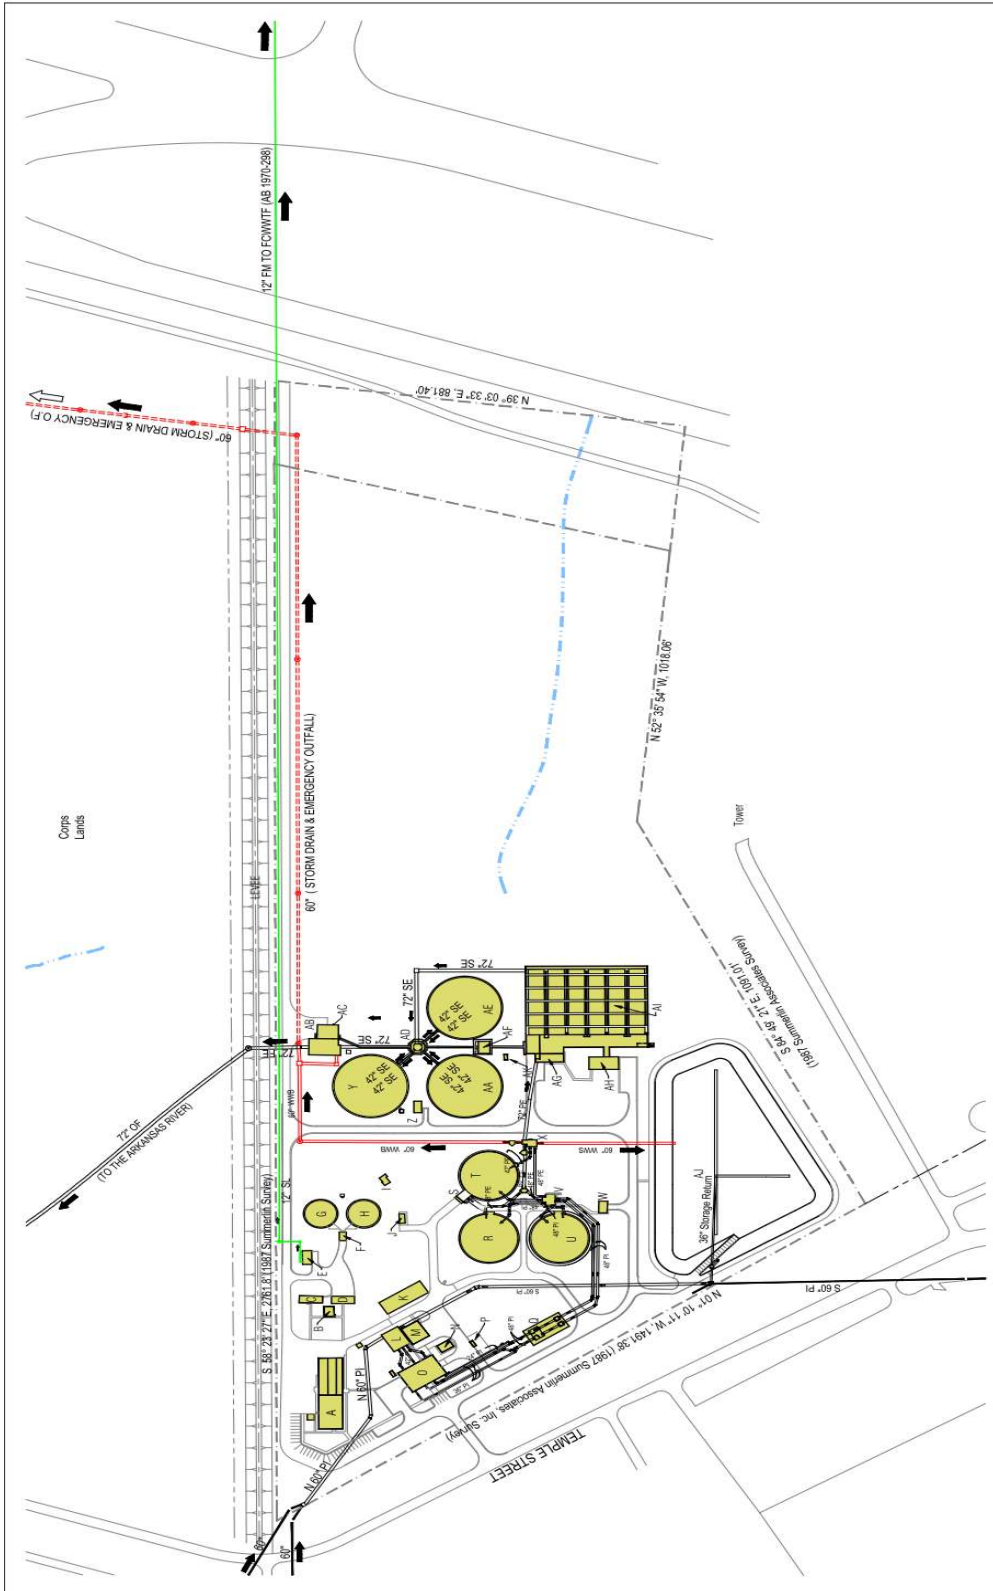

7. Volume of Waste Flow

The Adams Field Plant's effluent flows during the biomonitoring sampling event were:

TOXICITY TEST REPORT - CHRONIC

Client ...Little Rock Water Reclamation Authority	Sample Outfall 001
Facility ..Adams Field Water Reclamation Facility	Laboratory I.D. 31778
Permit No. NPDES AR0021806	Begin Date August 11, 2020

Results: **Pass** *Ceriodaphnia dubia* survival and reproduction and *Pimephales promelas* survival and growth at the critical low flow concentration (21% effluent).

SAMPLE COLLECTION

Composite effluent samples from Little Rock Water Reclamation Authority, Adams Field Water Reclamation Facility were delivered by Greyhound Package Express courier to Huthur & Associates on August 11, August 13, and August 15, 2020. Effluent samples were collected from Outfall 001 using an automatic sampler and were manually composited by facility personnel. Two toxicity tests were requested: a seven-day *Ceriodaphnia dubia* survival and reproduction test (EPA Method 1002.0), and a seven-day *Pimephales promelas* larval survival and growth test (EPA Method 1000.0). Test organisms, procedures and quality assurance requirements were in accordance with the EPA manual, "Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms, Fourth Edition" (EPA-821-R-02-013).

The effluent and receiving water samples were analyzed for total residual chlorine (Standard Methods, 23rd Edition, 4500-Cl D) and contained <0.01 mg/L, <0.01 mg/L, and <0.01 mg/L, respectively. Effluent and receiving dilution water hardness, alkalinity, conductivity, pH, and dissolved oxygen data were collected and recorded.

TEST SETUP
Ceriodaphnia dubia

The seven-day *Ceriodaphnia dubia* survival and reproduction test was initiated at 1445 hours, August 11, 2020. Five concentrations were prepared (9%, 12%, 16%, 21%, and 28% effluent) utilizing receiving water (Arkansas River) as dilution water. The test was conducted in 25 mL distilled water rinsed plastic beakers containing 15 mL of solution (one organism per beaker, ten beakers per concentration). *C. dubia* neonates were less than 24-hours-old and within eight hours of the same age at test initiation. Neonates were placed in beakers following a randomized block test design. Fresh solutions were prepared and renewed daily. Daily feeding consisted of 0.5 mL *Selenastrum capricornutum* and cerophyll per test chamber. The test proceeded for seven days during which survival, reproduction and water quality data were collected daily.

A true control of five replicate beakers of eight larvae each in receiving water was conducted concurrently with the test. There was 100% survival in the true control. In addition, a performance control of five replicate beakers of eight larvae each in synthetic laboratory water was conducted concurrently with the test. The purpose of the performance control was to assess the health of the test larvae and to identify receiving water toxicity. The performance control data was not used in the statistical analysis of the test data. There was 100% survival in the performance control. At the end of the test, all larvae were sacrificed, dried, and weighed. The test ended at 1450 hours, August 18, 2020. Survival and growth (weight) data were statistically analyzed ($p = 0.05$) according to EPA procedures to determine the Lowest Observable Effect Concentration (LOEC) and the No Observable Effect Concentration (NOEC).

SURVIVAL
Pimephales promelas

There was 100% survival to *P. promelas* in all of the effluent concentrations tested. Therefore, statistical analyses were not required to determine a no effect concentration.

LOEC: Not Applicable
NOEC: 28% Effluent

GROWTH
Pimephales promelas

P. promelas growth data were normally distributed at the 0.01 alpha level (0.900) using Shapiro Wilk's test for normality. Growth data were homogeneous using Bartlett's test at the 0.01 alpha level (15.09) without data transformations. Therefore, a parametric test was performed on the homogeneous data. Dunnett's test on *P. promelas* growth data demonstrated that there were no statistically significant differences between the control and any of the effluent concentrations.

LOEC: Not Applicable **PMSD: 7.8%**
NOEC: 28% Effluent

SUMMARY

There were no statistically significant differences between the control and the critical low flow concentration (21% effluent) for *C. dubia* survival and reproduction and *P. promelas* survival and growth. Based on biomonitoring requirements for Outfall 001 contained in Permit Number NPDES AR0021806 for Little Rock Water Reclamation Authority, Adams Field Water Reclamation Facility, Outfall 001 **passed** for this testing period.
