**2001 ANNUAL GROUND WATER REPORT
EL DORADO CHEMICAL COMPANY
EL DORADO, ARKANSAS**

1.0 INTRODUCTION

This report presents the results of ground water sampling activities conducted at the El Dorado Chemical Company (EDC) facility during 2002. Field sampling techniques, ground water flow and ground water quality are discussed. A site map is provided as Figure 1.

2.0 SITE GEOLOGY

The EDC facility is located west of the Mississippi Embayment in the Gulf Coastal Plain Geostratigraphic Region. Sediments within the region are characterized as a thick sequence of unconsolidated sediments, fluvial-deltaic in origin, and Tertiary in age. In some areas of Union County, unconsolidated alluvial deposits, Quaternary in age, overlay the Tertiary sediments.

Within the Claiborne Group, two units crop out in Union County, the Cook Mountain Formation and the Cockfield Formation. The Cook Mountain is overlain by the Cockfield Formation. The Cook Mountain is uniformly underlain by the Sparta Sand. The Cook Mountain is 50 to 200 feet thick and is composed of clay and silty clay containing minor amounts of localized very fine to silty sand. These clays serve as a confining unit between the more permeable overlying Cockfield Formation and the underlying aquifer. The Cockfield Formation, locally referred to as the "lignite sand", is generally characterized by fine sand, interbedded silty clay and lignite becoming more massive and containing less silt and clay with depth. The local shallow subsurface consists of interbedded sand, silty sand, silt and clay with more clay in the northern area of the property and more sand to the south.

3.0 GROUND WATER SAMPLING

3.1 FIELD SAMPLING

Ground water sampling events were conducted in June, October and December of 2002. Ground water elevations used to construct the maps on Figures 2, 3 and 4 were obtained on June 3, 2002,

October 29, 2002 and December 10, 2002. Depth-to-water measurements were collected from each well using an electronic water level indicator. The device was decontaminated between each well to minimize cross-contamination. Depth-to-water measurements were subtracted from their respective top-of-casing elevations to calculate ground water elevations referenced to Mean Sea Level (MSL) at each well. Monitoring well construction details are provided on Table 1. Ground water elevations for 2002 sampling events are summarized on Table 2.

The depth-to-water measurements were used to calculate the volume of water within each well and determine the amount to be purged prior to sampling. Three well volumes were removed from each well or until the well became dry using either a disposable bailer or a Redi-Flo electric pump. When a pump was used, dedicated polyethylene tubing was used for each well to minimize the potential for cross-contamination. Field indicator parameters (pH, conductivity and temperature) were recorded after removal of each well volume. Field meters used to measure field data were calibrated each day during sampling. Ground water indicator parameter data (final readings only) are summarized on Table 3. Purge water was containerized for proper disposal.

Ground water samples were collected using new, clean, dedicated, disposable polyethylene bailers. Ground water samples were placed into laboratory-provided containers with the appropriate preservatives. The containers were packed in ice-chests and shipped to the laboratory under chain-of-custody.

3.2 LABORATORY ANALYSIS

Ground water samples were analyzed by Arkansas Analytical, Inc. in Little Rock, Arkansas. Arkansas Analytical is certified by the Arkansas Department of Environmental Quality. The analytical reports are provided in Appendix A.

Ground water samples were analyzed for the following constituents:

PARAMETER	ANALYTICAL METHOD
Ammonia-N	350.3
Nitrate-N	300.0
Sulfate	300.0
Total Dissolved Solids (TDS)	160.1
Lead (Total and Dissolved)	200.7
Chromium (Total and Dissolved)	200.7

Field quality assurance/quality control (QA/QC) samples consisted of five duplicate samples collected during the June sampling event and four duplicates collected during the December sampling event. In addition, three field blanks were collected and analyzed in June 2002. Only low levels of dissolved solids (12 to 18 mg/L) were detected in the field blanks. No QA/QC samples were collected during the October 2002 sampling event.

4.0 RESULTS

4.1 GROUND WATER FLOW

The June 2002 ground water elevations ranged from 148.96 feet (MSL) in MW-EDC-18 (located east of Lake Kildeer) to 203.88 feet in MW-EDC-1 (located northwest of the facility). In October 2002, ground water elevations ranged from 148.34 feet in MW-EDC-18 to 202.80 feet in MW-EDC-1. The December 2002 readings were similar with a minimum elevation of 149.71 feet in MW-EDC-18 and a maximum elevation of 199.32 feet in MW-EDC-1. Consistent with previous measurements, the ground water flow direction is from northwest to southeast with the exception of localized areas where shallow perched ground water likely exists. Ground water elevation maps for each sampling event are presented on Figures 2 through 4.

4.2 GROUND WATER QUALITY

4.2.1 Field Parameters

Indicator parameter data are summarized on Table 3. In 2002, pH values ranged from 3.7 to 6.7, with most readings consistent with the previous measurements. Conductivities ranged from 75

to 7600 microSiemens (μS) in 2002. Wells MW-EDC-4, MW-EDC-6 and MW-EDC-8 consistently have the highest conductivity readings.

4.2.2 Analytical Results

The analytical results are summarized in Tables 4 through 21 and the laboratory reports are provided in Appendix A. A discussion of each constituent is provided below:

Ammonia

The June 2002 analytical results show ammonia values ranging from below detection (<0.5) to a maximum of 551 mg/L detected in MW-EDC-8. Four of the eighteen wells sampled had concentrations above the detection limit. In October 2002, 14 wells had detections of ammonia with a maximum concentration of 406 mg/L in MW-EDC-8. In December, there were detections in 8 wells with MW-EDC-8 having the maximum concentration at 220 mg/L. Ammonia isoconcentration contours for all three sampling events are presented on Figures 5 through 7. As shown on all three figures, the highest ammonia concentrations are located north of the acid and nitrate process areas known as the Production Area. There were also detections on the north and southeast sides of Lake Kildeer.

Nitrate

Analytical results from the June 2002 sampling event show values ranging from below the detection limit of 0.5 mg/L to 1070 mg/L (MW-EDC-8). Twelve of the eighteen wells had detections of nitrate. October analytical results show a maximum concentration of 1330 mg/L with thirteen wells having detections. The December results are very similar with concentrations ranging from below detection to 1080 mg/L. MW-EDC-8 had the maximum concentration in all three sampling events and nitrate concentrations were very consistent with previous measurements. Isoconcentration contours for each sampling event are illustrated on Figures 8 through 10. As shown on the figures, the highest nitrate concentrations are located north of the acid and nitrate process areas known as the Production Area. Elevated nitrate levels were also present on the north and south sides of Lake Kildeer during all sampling periods.

Sulfate

Analytical results show concentrations ranging from 3.22 mg/L (MW-EDC-18) to 979 mg/L (MW-EDC-4) in 2002. Wells MW-EDC-4, MW-EDC-5, MW-EDC-9, MW-EDC-11, and MW-EDC-13 typically have the highest concentrations; whereas, MW-EDC-1, MW-EDC-16 and MW-EDC-18 have the lowest. Results from all three sampling periods were generally consistent.

Total Dissolved Solids

TDS concentrations ranged from 44 mg/L (MW-EDC-1) to 5360 mg/L (MW-EDC-4) during 2002. Wells MW-EDC-4, MW-EDC-6 and MW-EDC-8 (located north of the Production Area) consistently have the highest TDS levels; whereas, MW-EDC-1, MW-EDC-3 and MW-EDC-15 have the lowest. Results from all three sampling periods were generally consistent.

Lead (Total and Dissolved)

Total lead was detected in three wells during the June 2002 sampling event. Wells MW-EDC-7 and MW-EDC-18 had concentrations of 0.031 and 0.115 mg/L, respectively. A duplicate sample for MW-EDC-8 contained a total lead concentration of 0.031 mg/L. In October, total lead was detected in MW-EDC-4 (0.02 mg/L), MW-EDC-7 (0.017 mg/L) and MW-EDC-18 (0.018 mg/L). In December, dissolved lead was detected in MW-EDC-7 at a concentration of 0.016 mg/L. Lead has been detected at low levels in these wells during previous sampling events.

Chromium

In June 2002, total chromium was detected in MW-EDC-18 at concentrations of 0.147 mg/L (total) and 0.137 mg/L (dissolved). Total chromium was detected again in MW-EDC-18 at the detection limit of 0.02 mg/L in December 2002. No chromium was detected during the October sampling event.

EDC-MW-16	2/12/1996	19.3	9.3 to 19.3	180.14
EDC-MW-17	2/13/1996	34.7	24.7 to 34.7	185.40
EDC-MW-18	2/22/1996	17.2	7.2 to 17.2	155.46

Notes:

1. All wells constructed of 4-inch Sch. 40 PVC flush threaded pipe
2. All well screens are 4-inch diameter, 10-foot length and 0.01-inch openings
3. All casing risers are approximately 3 feet above ground surface
4. All wells drilled with hollow-stem auger
5. Data from Woodward-Clyde June 1996 Report
