Katherine,

The WMP has been updated to include the usage of package treatment plant 1. The contractor working on plant rehab informed me that plant 1 is ready to go back online. There is not very much alteration to the WMP, but I didn't know if you would like me to send the entire document of just send in the narrative.

I will be leaving the office early today, but if you could let me know how you would like it submitted, I can take care of it first thing in the morning.

Thanks,

Barret R. Knutson, E.I.

CITY OF CAVE SPRINGS WASTEWATER TREATMENT PLANT
WASTE MANAGEMENT PLAN FOR THE
SUBSURFACE DISPOSAL OF MUNICIPAL WASTEWATER

1. This waste management plan is prepared on behalf of the City of Cave Springs by McClelland Consulting Engineers, Inc. of Fayetteville, Arkansas. The design and implementation of this plan shall be in accordance with all applicable State and Federal regulations and Department of Environmental Quality guidelines and policies and describes the collection, treatment, and disposal of wastewater collected from local subdivisions. Final effluent generated from the treatment plant is disposed of via subsurface drip irrigation underneath The Creek Golf Course in Cave Springs, Arkansas.

2. This plan has been developed in accordance with the guidelines provided by the ADEQ. Design information, operational recommendations, calculations and other items presented herein are based on plans, verbal representations by the system operators and information provided by others and are therefore subject to the interpretations of the waste management plan engineer. Engineering documents created by others which may be used as the basis for calculations remain the sole responsibility and liability of the original design professional and in no way shall the waste management plan engineer accept any liability or responsibility for their use or interpretation.

3a. Waste Generating Process – The city of Cave Springs owns and operates a wastewater treatment plant. The wastewater treatment system consists of two separate package treatment plants which dispose of effluent via subsurface drip irrigation. Treatment Plant #1 (TP1) is designed to treat a maximum daily load of 97,000 GPD, while Treatment Plant #2 (TP2) has a much higher capacity of 320,000 GPD.

The purpose of the treatment facility is to take in septic tank waste through utilization of a Septic Tank Effluent Pumping (STEP) system. The STEP system collects septic tank effluent from individual lots located around the City of Cave Springs. Lift stations pump the septic tank effluent from neighborhoods to the treatment plant through the City's sanitary sewer force main system. Currently there are 1774 lots platted for connection to the treatment system, however, as of August 2018 only 831 residences are connected to the treatment plant. *Table 1* shows information available on current and future lots proposed to be hooked up to the system.

When the septic tank effluent arrives at the plant, the flow is first sent through a biological treatment unit comprised of two 19,000 gallon parallel Lotus aerobic moving bed biofilm reactors (MBBR). Rotary blowers are used to supply air to the biological units for oxygenation, which allows for the removal of BOD. Downstream of the MBBRs are two 26-foot diameter secondary clarifiers, effluent coming from the MBBRs is sent through a splitter box and the streams are routed to two Lakeside secondary clarifiers. The clarifiers allow for flow equalization and separation of liquid and sludge during retention. A chemical feed station is available for the addition of chemicals during the

treatment process to add alkalinity for pH control and/or coagulant for use as a solids settling agent. The final liquid effluent is sent to separate dosing tanks where it will eventually be pumped through an underground leach field piping system and released via subsurface disposal. The resultant sludge, removed from the bottom of the clarifiers, is sent to the concrete sludge holding tank.

Effluent generated from TP1 is used to dose leach fields 1 and 2 (see *Engineering Drawings*) with each drip field containing many smaller sub-segments referred to as zones. The leach fields connected to TP1 have a dedicated storage tank which holds effluent prior to subsurface discharge through the leach lines. Effluent is pumped from the holding tank at regular time intervals, dosing rates are based on the area of each zone and regulatory requirements contained within the No-Discharge Permit.

Dripfields 1 & 2 contain zones 1 through 4 and connects to pump dosing tank 1 with a volume of 38,000 gallons. Dripfield 1 contains the original dosing zone designed by ESI and located on the golf course driving range. Dripfield 2 contains zones 1-4. Further analysis of the dosing rates can be seen in the *Design Calculation* portion of this report.

Effluent generated from TP2 is used to dose leach fields 3 through 5 (see *Engineering Drawings*) with each drip field containing many smaller sub-segments referred to as zones. Each leach field has a dedicated storage tank(s) which holds effluent prior to subsurface discharge through the leach lines. Effluent is pumped from the holding tanks at regular time intervals, dosing rates are based on the area of each zone and regulatory requirements contained within the No-Discharge Permit.

Dripfield 3 contains zones 5 through 12 and connects to pump dosing tank 3 with a volume of 25,000 gallons. Dripfield 4 contains zones 13 through 24, except for zone 18 which is not utilized, and connects to pump dosing tanks 4A and 4B, both with volumes of 20,000 gallons. Dripfield 5 contains zones 25 through 31 and connects pump dosing tank 5 with a volume of 20,000 gallons. In total TP2 has 3 separate leach fields supplying effluent to a total of 27 zones, with alternate fields available for use to allow for downtime of operational zones. Further analysis of the dosing rates can be seen in the *Design Calculation* portion of this report.

3b. Engineering Drawings – Drawings showing dimensions and sizes of piping, septic tanks, and leach fields can be seen in *Appendix A*.

3c. Design Calculations – Design calculations performed by the designing engineering consulting firm can be seen in the attached *Appendix B.* Since the time of the initial plant design, McClelland Consulting Engineers, Inc. (MCE) has been hired by the city of Cave Springs to work as the consulting engineers for the wastewater treatment plant.

3d. Copies of 8-1/2 × 12" USGS Topographic Maps (see *Appendix C*) and county maps showing:

- The location of the treatment facilities and leach field areas
- The nearest affected stream
- The distance and direction to the nearest State Highway
- Buildings near the site not labeled on the map
- A legal description of the waste-generating facility
- Location of the facility by longitude and latitude
- Name of the USGS quad map (Bentonville South and Springdale)

3e. Nearest Stream – The nearest stream is Osage Creek thence to the Illinois River, located at a distance of approximately 600 feet from the treatment facility. Osage Creek and the Illinois River are currently listed on the 2008 List of Impaired Waterbodies (303d list) for Total Phosphorus.

3f. Cover Crop – There are several different cover crops located on top of the leach fields, with the main crop consisting of Bermuda grass, with a nitrogen uptake rate of 300 lbs/acre. Bermuda is used for the fairways and rough on the golf course however in out-of-bounds regions, located further from the fairways, Fescue and Rye grasses can also be found but are less prevalent. PAN calculations are regularly submitted as part of the City's MMR submittals.

4. Soils Analysis – The soils analysis conducted prior to construction of the facilities can be is attached in *Appendix D.*

5. Depth-to-Groundwater – The depth to groundwater is periodically checked at a location of average elevation through a monitoring well. In order to stay in compliance with their permit the city must have a minimum of 5-feet of soil depth between discharge and the groundwater. The actual depth-to-groundwater was measured at 65".

6. Proof of Ownership – A copy of the Warranty Deed is attached as *Appendix E*.

7. Department of Health Notification – *Appendix F* provides a copy of the original letter notifying the Arkansas Department of Health (ADH) Division of Engineering that a permit was submitted to the ADEQ.

8. Disclosure Statement – A Disclosure Statement is not applicable to this facility.

GENERAL GRADING NOTES

A. PRIOR TO INSTALLATION OF WATERLINE OR SANITARY SEWER, THE CONTRACTOR SHALL EXCAVATE, VERIFY, AND CALCULATE ALL CROSSINGS AND INFORM THE OWNER AND THE ENGINEER OF ANY CONFLICTS PRIOR TO CONSTRUCTION. THE ENGINEER WILL BE HELD HARMLESS IN THE EVENT THE ENGINEER IS NOT NOTIFIED OF DESIGN CONFLICTS.

B. ALL SLOPES AND AREAS DISTURBED BY CONSTRUCTION SHALL BE GRADED SMOOTH AND 4" OF TOPSOIL APPLIED. IF ADEQUATE TOPSOIL IS NOT AVAILABLE ON SITE, THE CONTRACTOR SHALL PROVIDE TOPSOIL, APPROVED BY THE OWNER, AS NEEDED. THE AREA SHALL THEN BE SEEDED, FERTILIZED, MULCHED, WATERED AND MAINTAINED UNTIL HARDY GRASS GROWTH IS ESTABLISHED IN ALL AREAS (SEE LANDSCAPE PLAN FOR SEED MIX AND PROPER APPLICATION RATE). ANY AREAS DISTURBED FOR ANY REASON PRIOR TO FINAL ACCEPTANCE OF THE PROJECT SHALL BE CORRECTED BY THE CONTRACTOR AT NO ADDITIONAL COST TO THE OWNER.

C. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES, AND WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES.

RE: Irrigation lines on the The Creeks
Highway 112, Cave Springs, AR

To Whom It May Concern:

Soil pit analyses were made of 105 pits as marked by surveyors from CEI Engineering to determine seasonal water tables and loading rates by Reba Bailey, DR and Glen Laurent, P.S.C. on June 7th and 8th, 2005. This information is also being provided to Benny Mays, E.H.S. from the Benton County Health Department.

This information is pertinent to the area of the property where the soil pits were dug. Pit locations must be shown on the plat. 15 other proposed pits were not dug due either to proximity to ponds, irrigation lines, putting greens or stakes not found. Notes referring to this are included on the attached analysis chart.

The drip field disposal field sizes and loading rates are taken from the Arkansas Department of Health Guidelines for the Design and Construction of Drip Dispersal Systems provided to the designated representatives. Pits were reviewed by Benny Mays, Environmental Health Specialist, on June 7th, 2005. Pit locations considered unsuitable for irrigation lines and proposed pit sites not dug are noted on the plat provided by CEI Engineering.

Sincerely,

Reba Bailey, R.S.

Introduction

This report was prepared to provide information for health department approval of the proposed irrigation lines using treated effluent on The Creeks Golf Course.

105 soil pits were dug and soil pit analyses were made on June 7th and 8th, 2005. A health department representative reviewed the pits and concurred with our findings.

Soil pit locations are indicated on the plat provided by CEI Engineering Associates. Related loading rates are pertinent to the referenced pit locations.

Site description

The proposed drip dispersal field is located on The Creeks Golf Course located on Highway 112 in Cave Springs, AR in Benton County. Areas analyzed were staked and identified by CEI Engineering Associates.

Methods

This investigation was performed by digging four feet deep soil pits based on a 100 foot grid in the non disturbed areas over much of the golf course. All soil interpretations and profile descriptions were made by Glen Laurent, Arkansas Registered Professional Soil Classifier. Seasonal water table depths were determined by Reba Bailey, Designated Representative #269 and Glen Laurent, Arkansas Registered Professional Soil Classifier. Soil pits were reviewed by Benny Mays, Environmental Health Specialist with the Arkansas Department of Health.

Loading rates were based on the seasonal water tables and interpretations were made using the Arkansas Department of Health Guidelines for the Design and Construction of Drip Dispersal Systems
