Mo, good questions on Captain Black Lake. We don't have much information on the lake ourselves. The latitude / longitude we gave you guys was off. Look again at Latitude: 33° 13' 25", Longitude: 93° 42' 30". The directions provided in the report (10 miles south and 7 miles west of Lewisville) are accurate. The lake is an old oxbow, formed in the late 1940's by the Red River. I have attached a satellite photo that should give you a good look at the configuration of the lake. Captain Black Lake is the larger lake in the middle of the photo (the water appears dark). I will also check our field records but doubt that we have much depth data since physical measurements of the lake and EQ Basin were not included in the workplan. I will check our field notes and put together any additional information we have on Captain Black.

As far as designated uses of the lake that is probably a better question for your water quality standards people.

Although we don't sample that lake as a part of our lakes assessment, it would have the same designated uses as the other lakes in the state, with the same water quality protection mechanism. Why did they do a study on a Red River oxbow, and not one along the Ouachita River, where EDCC is located?

Ok, have I sent you enough information for now? If so, I can just wait until you guys send me any "ADEQ" comments you have. Does that sound OK?
