RE: Flood-Flow Modeling

Dear Ms. Ross:

This report supplants and combines previous versions of the flood flow modeling and the modeling basis documents. It includes new explanations for the data derivations.

AquAeTer, Inc. (**AquAeTer**) is pleased to present our findings of water quality modeling for two flood-flow conditions on the Ouachita River: 1) River stage 65 feet (ft) at Felsenthal Dam; and 2) River stage 75 ft at Felsenthal Dam. All elevations are given in the National Geodetic Vertical Datum of 1929 unless otherwise specified. The purpose of this modeling is to provide Georgia-Pacific (GP) with the results from a previously calibrated low-flow water quality model and previous water quality data[1] that was modified to estimate potential water quality effects during these two flood scenarios. It is our understanding that the Arkansas Department of Environmental Quality (ADEQ) has requested GP to determine if there are impacts from treated effluent discharged directly from Outfall 001 during these flood conditions.

AquAeTer utilized the existing approved water quality model for the Ouachita River, and modified it for these flood-flow conditions. Inputs expected during the flood-flow situations were used. New data were added to the model to represent water quality conditions that have been measured downstream from Felsenthal during the two critical months selected, i.e., May for 75 ft and June for 65 ft. All model files are provided in Attachment 1.

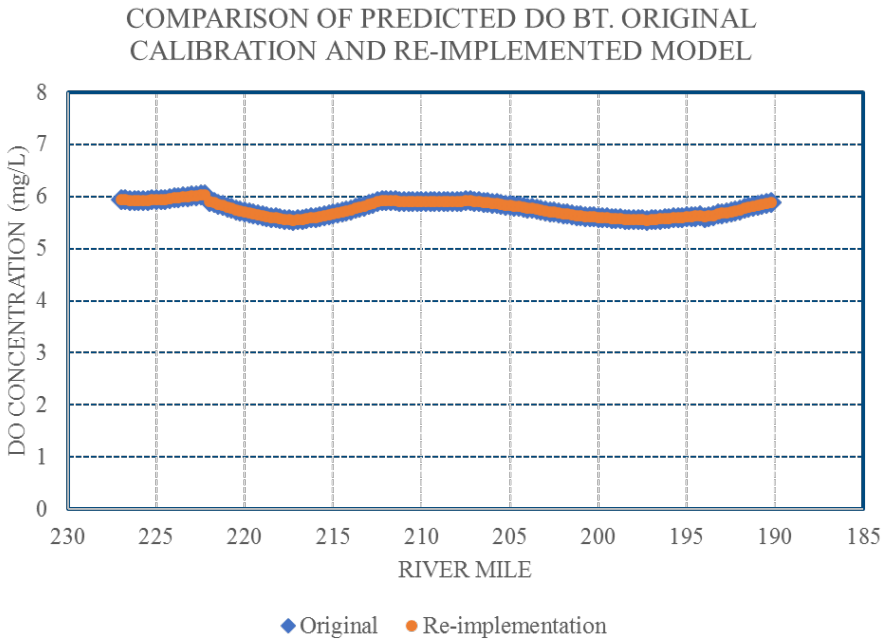
SUMMARY

Both flood scenarios show minimal impact to the Ouachita River for a non-conservative pollutant (dissolved oxygen) which resulted in an approximately 0.2 mg/L drop, and a conservative pollutant (copper) which resulted in a less than 0.15 microgram per liter (µg/L) increase in copper concentration. This matches historical measurements of DO concentrations in the Ouachita River during flooding conditions. We believe the water quality model described herein for the flood conditions modeled provides conservative predictions of water quality impacts. Due to the amount of river water and other flood flow conditions, we would not expect any significant impacts on water quality.

ORIGINAL MODEL

The model originally developed in QUAL2E and submitted to the ADEQ, Louisiana Department of Environmental Quality (LDEQ) and United States Environmental Protection Agency (USEPA) was retrieved from storage. The model was originally developed using WinQual, which ran on a version of Windows that is no longer used. The input deck was converted to work in the DOS-based QUAL-2E. The results were then compared and found to provide very similar results. The dissolved oxygen (DO) concentrations for the original model and the reimplemented model are presented in Figure 1. The maximum difference in the DO concentration between the model results is 0.01 milligram per liter (mg/L), which is less than the accuracy of DO measurements at ±0.1 mg/L.

Figure 1. Comparison of Original Calibrated Model and Re-Implemented Model Results



FLOOD MODEL CONDITIONS

The original model was developed for low-flow conditions and was calibrated at a flow of 980 cubic feet per second (cfs). The flows for the two flood conditions analyzed are substantially greater. The gage at Felsenthal was analyzed to determine an appropriate flow at the 65' elevation flood condition. However, the gage is not capable of measuring flows when the stage exceeds 65'. Therefore, flow data acquired during flooding periods were used from upstream and downstream gages to estimate the flow at a flood elevation of 75'. The following is a list of the parameters that were changed for each model condition.

Flow

At the 65' Flood, a flow of 17,250 cfs was used. This represents the lower end of the range measured during a flood condition. The lower end of the range represents the highest potential to see an effect from the permitted discharge. At the 75' Flood, a flow of 46,364 cfs was used. As with the 65' flood condition, this represents a flow on the lower end of the range for flows calculated during this flood condition.

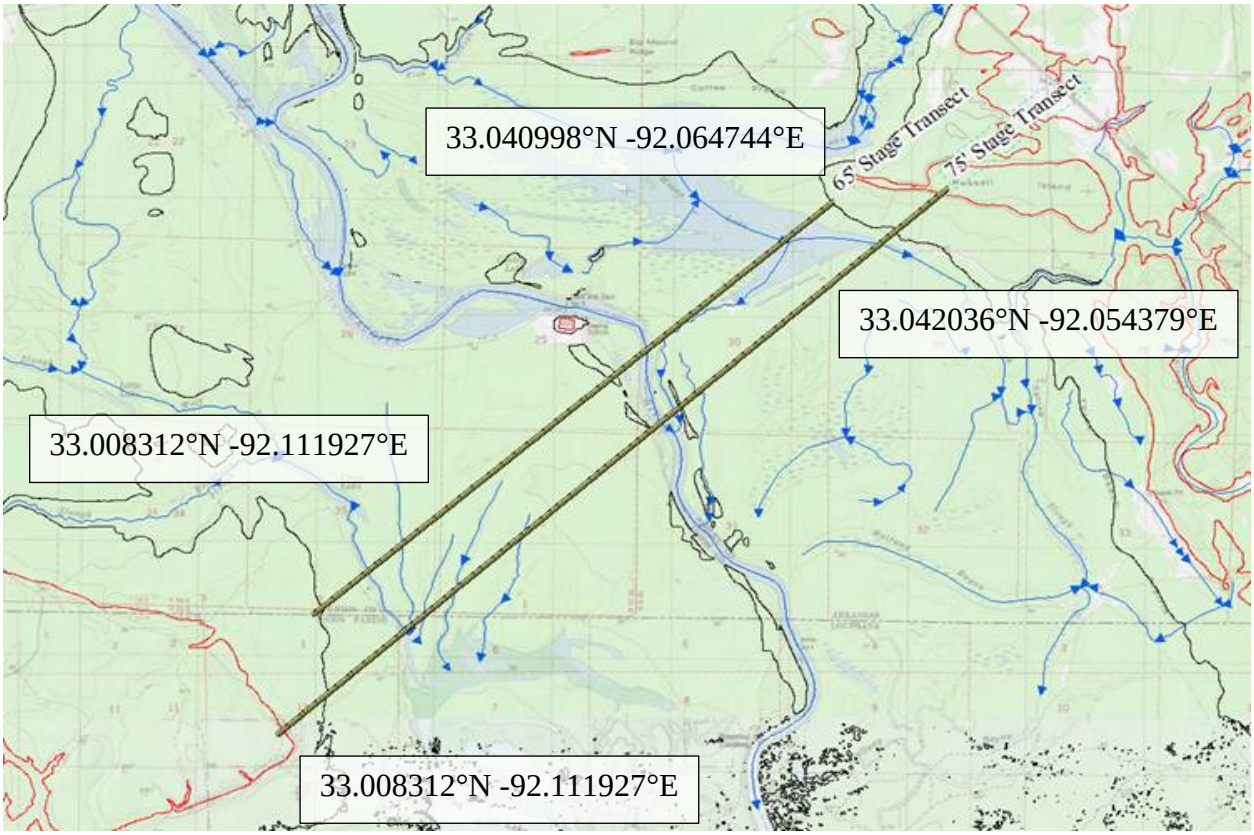
The flood flows were within the range measured or predicted at Felsenthal during the respective flood conditions for January 1, 2015 through June 30, 2016. At stages greater than 65' flood elevation, the Felsenthal gage no longer measures flow. For those days where the Felsenthal gage did not record flow, flows were projected by adding the flows from the following upstream gages. For comparison purposes, the Ouachita River at Felsenthal Lock and Dam is approximately 10,852 square miles. The ratio of flow per square mile was used to account for the increase in drainage area at Felsenthal.

a. USGS 07362000 Ouachita River at Camden, AR
   5,360 square miles;
b. USGS 07362100 Smackover Creek near Smackover, AR
   385 square miles;
c. USGS 07362500 Moro Creek near Fordyce, AR
   240 square miles;
d. USGS 07363500 Saline River near Rye, AR,
   2,100 square miles; and
e. Total miles included in gages = 8,085 square miles.

River Morphology

The digital elevation map (DEM) data were downloaded from the United States Department of Agriculture Geospatial website. The DEM filename is 10.2.gda.4357299, which covers Felsenthal Dam, AR-LA. The metadata information and the data dictionary defining the terms are provided in Attachment 2. One transect was drawn for the 65' flood elevation and one transect was drawn for the 75' flood elevation, as shown in Figure 2. The co-ordinates shown on the figure represent the beginning and ending points for each transect.

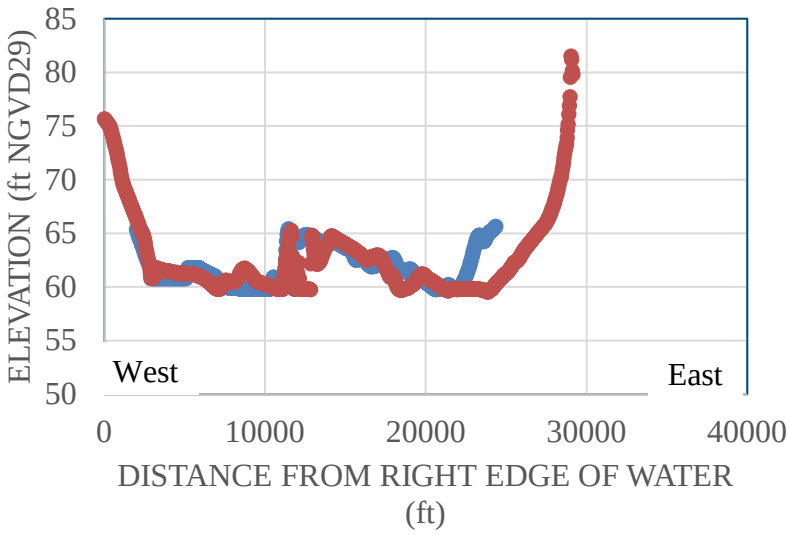
Figure 2. Transects for Flood Elevation Profiles



Depth Coefficient and Exponent

The DEM data were used to develop the cross-sectional area of the River during each flood. The depth profile along each is presented in Figure 3. These data were derived from the DEM using the geographic information system by ESRI (ArcGIS). The profiles are slightly different due to the offset distance of the two transects.

Figure 3. Transect Profiles for Flood Elevations



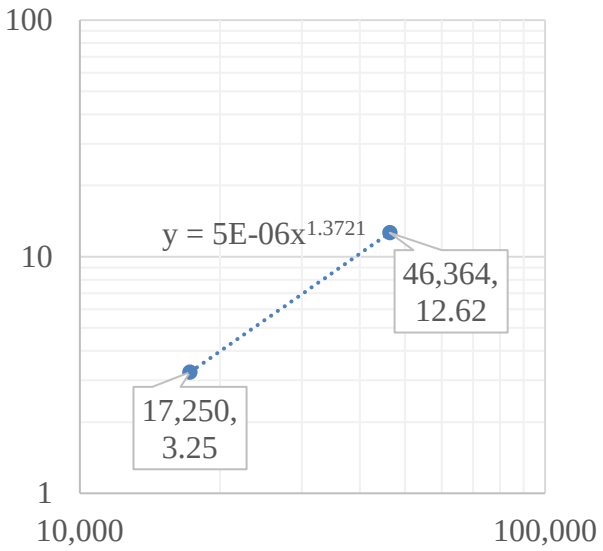
The data derived from the transects shown in Figure 3 are presented in Table 1. The average depth at one cross-section for each flood condition was determined using the cross-sectional data derived from the

DEM data. For the depth, the flood condition flows and depths were plotted on a log-log plot and a trendline was fitted to the two datapoints, as shown in Figure 4. These values, along with a comparison to the original values used in the model are presented in Table 2. The two sets of coefficients and exponents are different due to the significantly different flow and river channel transect characteristics.

Table 1. DEM-Based Data

Parameter	65' Flood Condition	75' Flood Condition
Width	21,777 feet	28,457 feet
Average Depth	3.25 feet	12.62 feet

Figure 4. Depth versus Flow for Flood Conditions



The coefficient and exponent calculated for the depth versus flow are shown after being rounded in Figure 4. The model has a limitation on the number of characters that a single value can have. The values derived from the data presented in Figure 4 are rounded, which can lead to differences in the values predicted by the equation.

The differences in the values between the original data and the values calculated by the model for each are shown in Table 3.

Table 2. Depth Coefficient and Exponent

Reach	Original Model Coefficient	Original Model Exponent	Flood Model Coefficient	Flood Model Exponent
1	7.17	0.05	$4.994*10^{-6}$	1.37
2	7.17	0.05	$4.994*10^{-6}$	1.37
3	7.17	0.05	$4.994*10^{-6}$	1.37
4	8	0.05	$4.994*10^{-6}$	1.37
5	12	0.018	$4.994*10^{-6}$	1.37
6	12	0.018	$4.994*10^{-6}$	1.37
7	15.03	0.011	$4.994*10^{-6}$	1.37
8	15.03	0.011	$4.994*10^{-6}$	1.37

Table 3. Comparison Between Data-Based Depth Value and Model Calculated Depth Value Due to Rounding

Flow (cfs)	Data-Derived Depth Value	Model Coefficient	Model Exponent	Model Calculated Depth Value
17,250	3.25 ft	$4.994*10^{-6}$	1.37	3.18 ft
46,364	12.62 ft	$4.994*10^{-6}$	1.37	12.33 ft

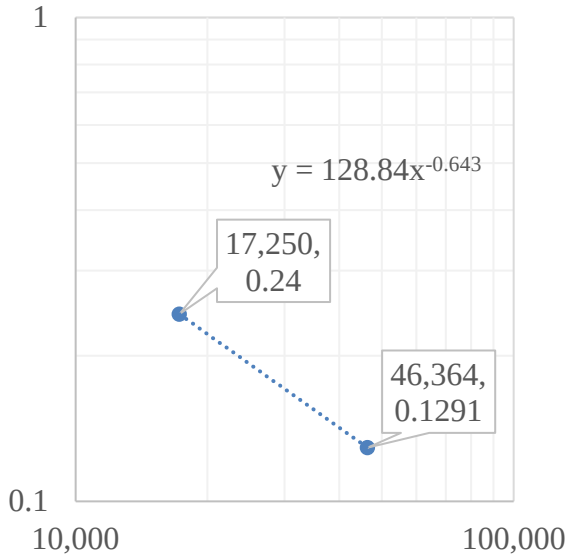
Velocity Coefficient and Exponent

The calculated area was calculated by multiplying the width by the average depth. The flow was then divided by the area to derive an average velocity for each flood condition. The area and velocity for each flood condition are presented in Table 4.

Table 4. Area and Velocity Calculated Based on DEM Data

Parameter	65' Flood Condition	75' Flood Condition
Area	70,774 square feet	359,127 square feet
Average Velocity	0.24 feet per second	0.13 feet per second

Figure 5. Velocity versus Flow for Flood Conditions



For the velocity, the flood condition flows and velocities were plotted on a log-log plot and a trendline was fitted to the two datapoints, as shown in Figure 5. The coefficient and exponent calculated for the depth versus flow are also shown after being rounded in Figure 5. The model has a limitation on the number of characters that a single value can have. The values derived from the data presented in Figure 5 are rounded, which can lead to differences in the values predicted by the equation. These coefficient and exponent values, along with a comparison to the original values used in the model are presented in Table 5.

While there are differences in the velocity calculated based on the DEM data and the velocity calculated based on the model variables, the differences are less than 0.01 feet per second. The values for the data-based velocity values and the values calculated by the model are shown in Table 6.

Table 5. Velocity Coefficient and Exponent

Reach	Original Model Coefficient	Original Model Exponent	Flood Model Coefficient	Flood Model Exponent
1	0.00046	0.897	128.756	-0.643
2	0.00046	0.897	128.756	-0.643
3	0.00046	0.897	128.756	-0.643
4	0.00046	0.897	128.756	-0.643

8	0.00020	0.930	128.756	-0.643

Table 6. Comparison Between Data-Based Velocity Value and Model Calculated Velocity Value Due to Rounding

Flow (cfs)	Data-Derived Velocity Value	Model Coefficient	Model Exponent	Model Calculated Velocity Value
17,250	0.24 ft/sec	128.756	-0.643	0.24 ft/sec
46,364	0.13 ft/sec	128.756	-0.643	0.13 ft/sec

It is important to remember that the original model variables were based on a low-flow scenario modeling the situation where the River was contained within its banks. At the two different flood scenarios, the River is no longer contained within a defined channel: to the contrary, it is primarily flowing through overbank areas that are frequently forested, which in turns slows the water velocity in these areas. The overall average velocity is thus significantly affected by these areas. During normal non-flooded conditions, the River is roughly 300 feet wide. The two transects for these flood elevations are over 21,000 and 28,000 feet wide, for the two modeled flood conditions. The original low-flow variables for velocity developed for the river when it is in-channel, did not predict the non-channel flow conditions, as discussed below and shown in Table 7.

While the negative exponent is not intuitive for channel-based flow calculations, it is expected when the River leaves its banks. In the overbank areas near Felsenthal, there is an increase in cross-sectional area flowing through the forested areas as the River stage rises. Additionally, the downstream dam location near Sterlington begins having a greater impact on water backing up at these higher stages. Thus, outside of the channel at higher stage, the average velocity should slow down. An example of the River in a flood condition is shown in Figure 6. Additional pictures of the Ouachita River during flooded conditions are provided in Attachment 3.

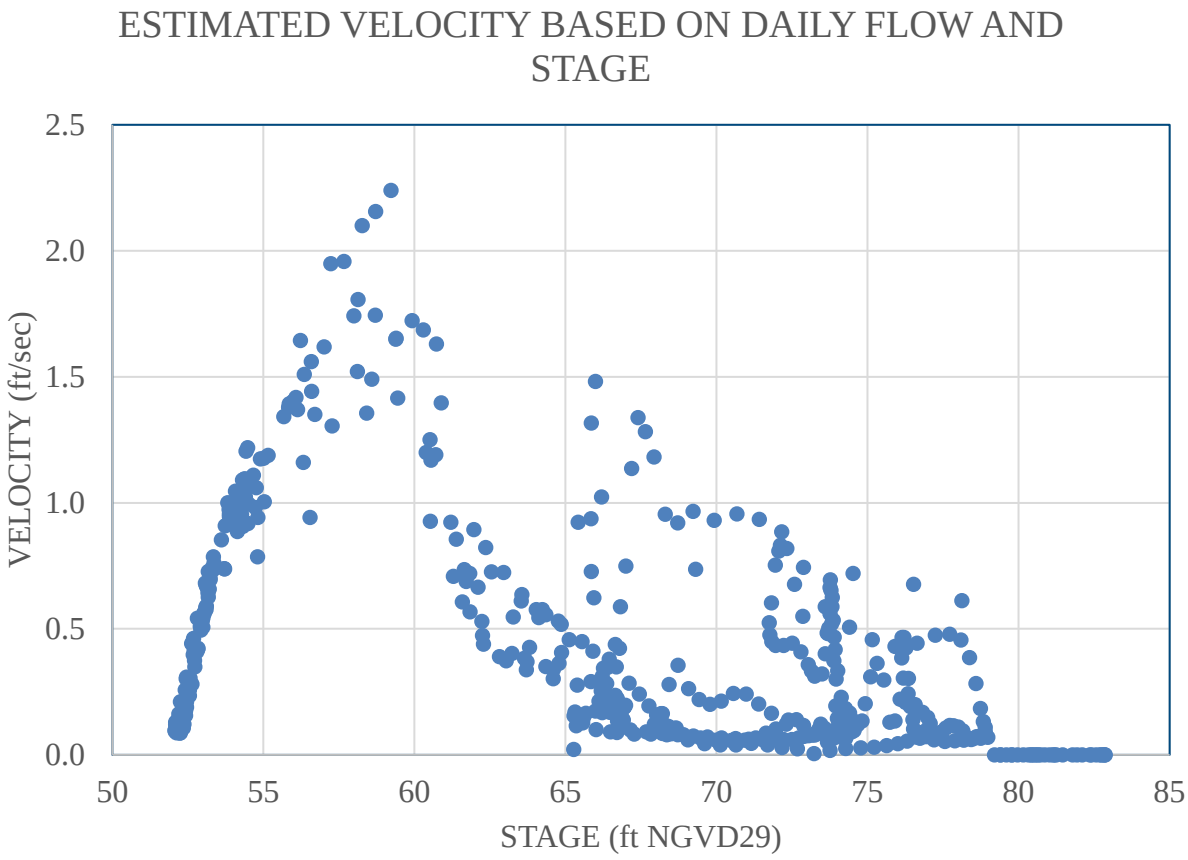
Table 7. Evaluation of Velocity Coefficient and Exponent

Stage	Total Area (ft^2)	Flow (cfs)	Average Velocity Calculated by Area (ft/sec)	Average Velocity Calculated using Original Variables (ft/sec)	Average Velocity Calculated using Flood-Flow Variables (ft/sec)
65	70,774	17,250	0.24	0.07	0.24
75	359,127	46,364	0.13	0.073	0.13

Figure 6. Ouachita River in Flood (at an estimated 62 Feet elevation) Viewed from the Dike at Mossy Lake

Using the same transect cross-sectional data to determine the velocity of the flows during the period from January 1, 2015 through June 30, 2016, the peak average velocity does not occur during the flood conditions. For this calculation, all stages less than or equal to the 65' used the transect for the 65' flood condition, while all stages greater than 65' used the 75' flood condition. The daily flow value was divided by the cross-sectional area of the River for the same daily stage to determine the velocity. The estimated River velocity is presented in Figure 7.

Figure 7. Estimated Velocity for Flow on the Ouachita River



$CBOD_u$ Deoxygenation Rate

The ultimate carbonaceous biochemical oxygen demand ($CBOD_u$) deoxygenation rate in the original model increased briefly after the addition of the discharge from Coffee Creek, from 0.05 to 0.075 day^{-1}. The River flow for the original calibrated model was 980 cfs and the Mill flow at 42.1 cfs represented approximately 4 percent of the downstream flow in the river. For the flooded condition, the effect of the treated effluent is expected to be minimal, based on a mass balance between the receiving stream and the Mill's loading which shows the Mill flow is less than about 0.25% of the River flow at the 65' flood condition. Therefore, the $CBOD_u$ deoxygenation rate was kept constant for all reaches at 0.05 day^{-1}.

Reaeration Rate

The original model utilized the O'Connor and Dobbins reaeration method. However, the changes to the model depth and velocity to account for the flood conditions did not produce similar predicted reaeration since the effective depth changes for the two flood scenarios. During flood conditions, the reaeration rate is expected to increase due to the increased turbulence. However, the mechanics of the O'Connor-Dobbins equation result in an increase in predicted reaeration for

the 65' flood scenario while also calculating a decrease in predicted reaeration for the 75' flood scenario. The O'Connor-Dobbins equation is as follows:

$$k_2 = 12.9\frac{U^{0.5}}{H^{1.5}} \quad \textbf{1}$$

where: k_2 = reaeration rate, day^{-1};
U = velocity, feet per second; and,
H = depth, feet

The depth and velocity are calculated based on the flow using the following equations, respectively. The coefficients and exponents used for the flood model were presented previously in Tables 2 and 5, respectively.

$$U = aQ^b \quad \textbf{2}$$

$$H = cQ^d \quad \textbf{3}$$

The calculation results are presented in the following table.

Table 8. O'Connor-Dobbins Reaeration Calculations for Flood Flow Conditions

PARAMETER	RESULT FOR 65' FLOOD	RESULT FOR 75' FLOOD
Q (cfs)	17,250	46,364
U (ft/sec)	0.24	0.13
H (ft)	3.25	12.62
k_2 (day^{-1})	1.09	0.103

The depth represents the average depth across the River. While the main channel of the River may be much deeper, the flood plain area brings the average down. Likewise, the velocity in the main channel is expected to be faster, but the velocity of the River moving through the flood plain will be impeded by the forests, which brings the average velocity down. Because of this, the O'Connor-Dobbins reaeration calculation was not used and an alternative approach was developed.

An alternative reaeration equation that is also accepted by the USEPA and is present in the QUAL2E model and newer models is the Tsivoglou-Neal reaeration rate equation. This equation relies on the water surface slope change. During low flows, the slope change on the Ouachita River was insignificant, resulting in unrealistic reaeration rates. For the flood flow, however, the change in slope between the Sterlington and Felsenthal gages is able to be used. The Tsivoglou-Neal reaeration rate equation is as follows:

$$k_2 = c * \frac{\Delta h}{TOT} \quad \textbf{4}$$

where: k_2 = reaeration rate, day^{-1};
c = escape coefficient, ft^{-1};
Δh = change in water surface elevation, ft; and,
TOT = time of water travel, day.

The escape coefficient can be adjusted based on flow conditions based on empirical data. There is one measurement in Arkansas that was made on the Ouachita River in 1980[2] in a study completed for NCASI[3][4]. One additional measurement was made on the Ouachita River, but was considered poor due to the hydraulic conditions occurring during the release. A similar swamp stream was tested by Law Engineering[5]. The Red River near Ashdown, Arkansas was also tested[6]. The "c" coefficient and flows for each of these studies is presented in Table 9.

Table 9. Escape Coefficients Measured

STREAM	"c"	FLOW (cfs)
Ouachita River (AR)	0.0396	850
Black Creek (SC)	0.0392	198
Red River (AR)	0.0822	4,600

These three studies were utilized to develop an empirical equation that relates the "c" coefficient to flow as follows:

$$c = 0.036e^{0.00018*Q} \quad \textbf{5}$$

Combining Equations 4 and 5 yields the following:

$$k_2 = 0.036e^{0.00018*Q} * \frac{\Delta h}{TOT} \quad \textbf{6}$$

For the 65' Flood scenario, the parameters used to determine the reaeration rate are presented in Table 10. An

Table 10. Tsivoglou-Neal Reaeration Prediction

Parameter	Value
Q	17,250 cfs
Δh	5.2[7] ft
TOT (days)	8[8] days
k_2	0.5 day^{-1}

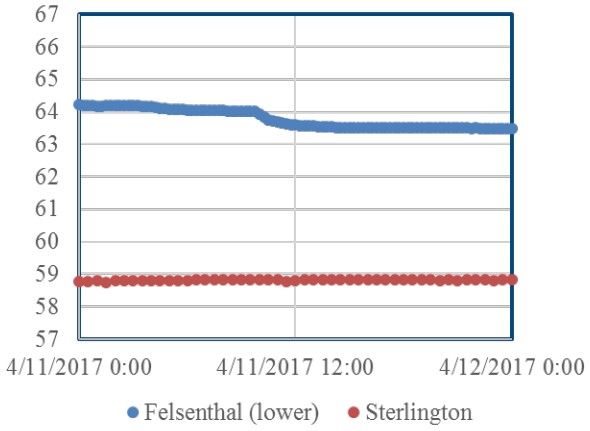
[7] Based on stage measured between Felsenthal and Sterlington during flooding.
[8] At 0.24 ft/s in Model domain from ORM 222 to 190.

example of the stage between the two gages is presented in Figure 8.

This value was utilized as the reaeration rate for the 65' flood condition. This represents a substantial margin of safety over what the O'Connor-Dobbins equation would predict based on the conditions during the flood.

Figure 8. Flood Stage at Felsenthal and Sterlington



For the 75' Flood Scenario, the reaeration rate is expected to be slightly lower than the 65' Flood Scenario. This is based on the decreased slope and increased time of travel as more water backs up from Sterlington. For this reason, a value of 0.3 day^{-1} was selected for the reaeration rate. This was based on meeting similar trends from historic data collections collected during flooding conditions, as well as previous reaeration measurements on the Ouachita River.

The reaeration rates utilized for the flood flow scenarios simulated a flatter DO slope as has been measured on the Ouachita River during flood flows as later shown in Figure 9. Utilizing the O'Connor Dobbins equations for these flood conditions would result in widely variable DO predictions that deviate from the known DO trends.

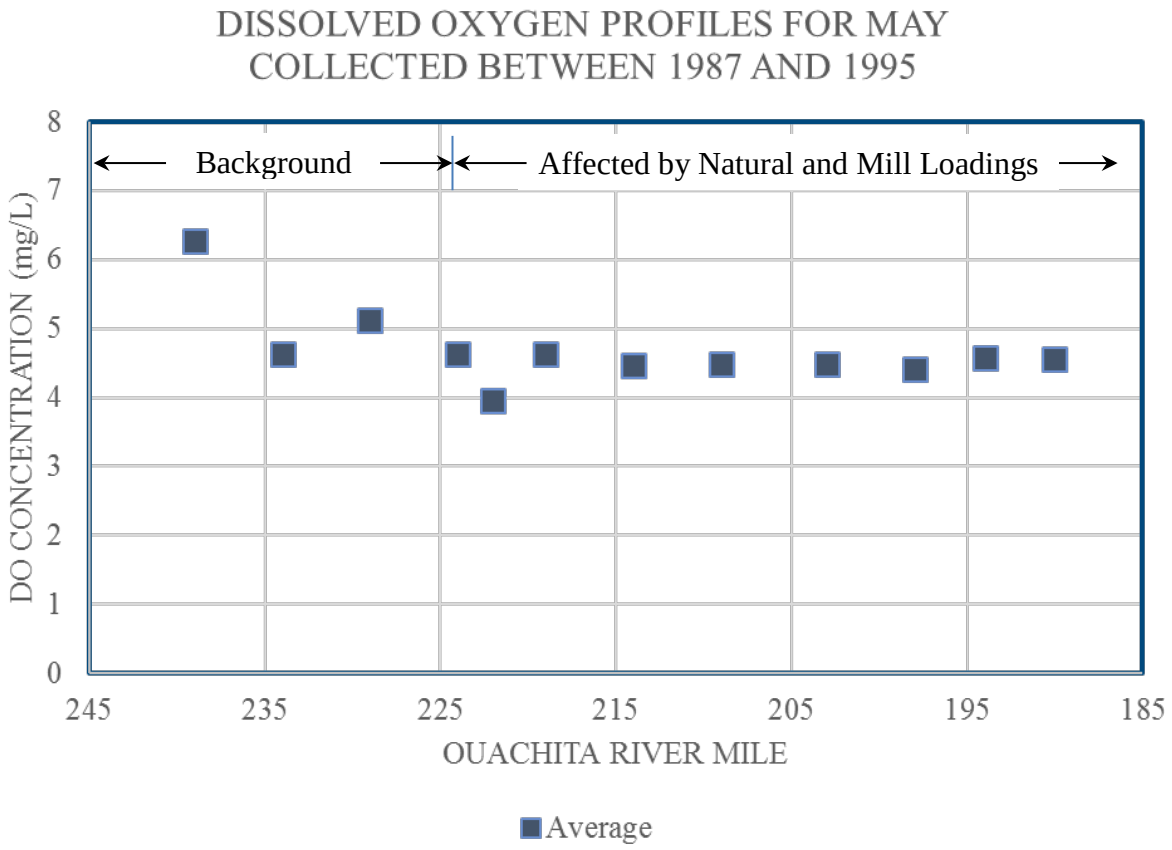
Linear Algal Self-Shading (ft^{-1} per µg/L Chlorophyll a) and Non-Algal Light Extinction

The initial run at the flooded condition failed to converge due to excessive algal growth. The linear algal self-shading parameter was adjusted from 0.0027 to 0.02. The non-algal light extinction coefficient was increased to 4 ft^{-1} for both flood models. These two parameters curtailed the algal population in the model, and allowed future model runs to converge. This is a reasonable assumption since algal activity would be expected to be significantly diminished during flood conditions.

Background DO Concentration

Based on the work AquAeTer performed for the Mill in developing a Use Attainability Analysis for the Ouachita River, we utilized a background DO concentration of 3.4 mg/L for the 65' flood scenario and 5.4 mg/L for the 75' flood scenario. These values were based on the data collected for June, representing the 65' flood condition, and May, representing the 75' flood condition. This is intended to represent a worst-case condition when the flooding has expanded into the stagnant water areas within the basin. This phenomenon was previously documented by AquAeTer, as shown in the Figure 9.

Figure 9. DO Data Originally Published in UAA[9]



Time of Year

In analyzing the frequency of flood events, floods at 65' or greater have occurred through June, while floods at 75' or greater have occurred through May. These two months were used for modeling purposes due to the potential for higher temperatures, which increases rates and decreases the amount of dissolved oxygen potentially present in the stream due to lower oxygen solubility at warmer temperatures.

Temperature

The original calibrated model was developed based on data collected during the field study. The temperature used was 88.7°F for the background river. The flooded conditions were evaluated to determine the most probable months for flooding. A temperature from that month was selected. The 65' flood model was run at a temperature of 87.4°F representing a June condition. For the 75' flood model, a temperature of 81.3°F was used representing a May condition. The initial

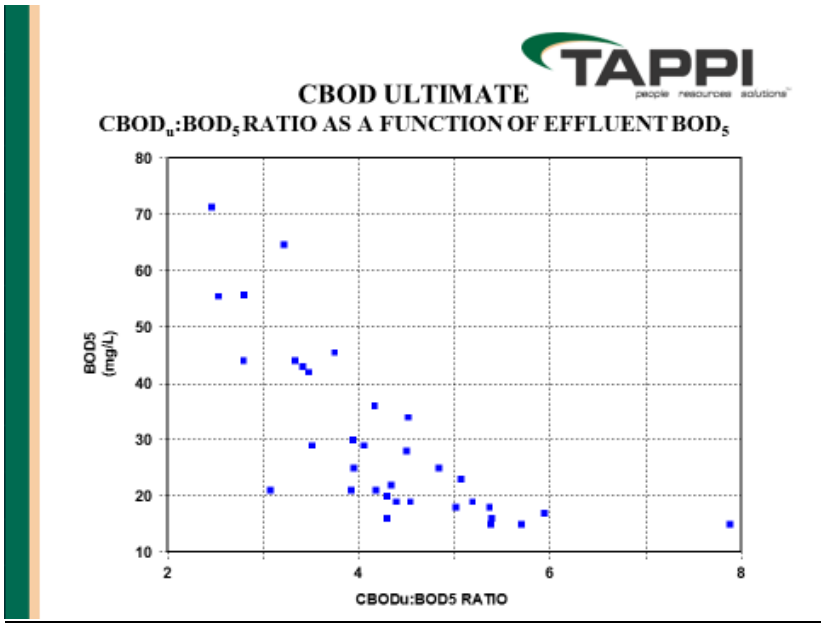
[9] Taylor and M.R. Corn. 1996. "Dissolved Oxygen Use Attainability Analysis: Ouachita River from Felsenthal, AR to Sterlington, LA", AquAeTer, Inc., Brentwood, TN.

conditions and background River temperature were adjusted for both models. Other temperature inputs were not adjusted from the original model.

Effluent Data

An effluent flow rate of 45 million gallons per day (mgd) or 69.63 cfs was used for the effluent flowrate. For each flood stage, an average and a maximum loading model run was completed. For parameters that did not have permit conditions, the original model calibration was utilized.

Figure 10. Relationship of BOD_5 Data to F-Factor



The permit is based on 5-day biochemical oxygen demand (BOD_5). The monthly average loading specified in the permit is 24,155.4 lbs/day of BOD_5. The daily maximum loading specified in the permit is 46,453 lbs/day. At an effluent flowrate of 45 million gallons per day (mgd), or 69.63 cfs, the monthly average and daily maximum BOD_5 concentrations would be 64.4 and 123.8 mg/L, respectively. The model requires this to be input as an ultimate carbonaceous biochemical oxygen demand ($CBOD_u$) concentration. The ratio of CBODu/BOD5 is called the f-factor. The f-factor came from $CBOD_u$ to BOD_5 f-factors developed at the Ashdown Mill when it was owned by Georgia-Pacific and which has been accepted by ADEQ previously for wasteload allocation work. The Ashdown Mill is now owned by Domtar. The f-factor data are shown in Figure 10. These data demonstrate a decreasing f-factor with increasing BOD_5. As effluent treatment increases (and BOD_5 concentrations go down), the percentage of recalcitrant $CBOD_u$ increases. When effluent treatment efficiency is lower (and BOD_5 concentrations are higher), the percentage of labile $CBOD_u$ remaining after treatment increases.

For the model, an f-factor of 3.4 was utilized. At a BOD_5 concentration of 64.4 mg/L, this results in a $CBOD_u$ concentration of 218.3 mg/L for the monthly average condition. At a BOD_5 concentration of 123.8 mg/L, this results in a $CBOD_u$ concentration of 420.9 mg/L for the daily maximum condition.

Copper

Copper was included in the model as a conservative mineral. There was not a significant dataset for hardness on the Ouachita River near Felsenthal. The average hardness for the background station was 21.3 mg/L as $CaCO_3$ for June and 22.5 mg/L for May, representing the 65'and 75' flood scenarios, respectively. At a hardness of 21.3 mg/L, the copper water quality standards are 3.96 µg/L and 3.03 µg/L for the CMC and CCC, respectively. At a hardness of 22.5 mg/L, the copper water quality standards are 4.17 µg/L and 3.17 µg/L for the CMC and CCC, respectively.

No Loading Condition

One model run for each flood scenario was completed in which the Mill discharge flowrate from the Aerated Stabilization Basin (ASB) was set to 0.

MODEL RESULTS

Both flood scenarios show minimal impact to the Ouachita River. The copper concentration for both flood scenarios also showed slight increases over the background concentration, but within the water quality standard for copper at the background hardness concentrations.

65' Flood Scenario

The results of the DO concentration at the 65' Flood Elevation are presented in Figure 11. A summary of the maximum delta DO concentration compared to the model run without the Mill's effluent is provided in Table 11. The difference in the DO concentration is within the accuracy of DO instrumentation, which is ±0.1 mg/L, which gives a potential swing of 0.2 mg/L.

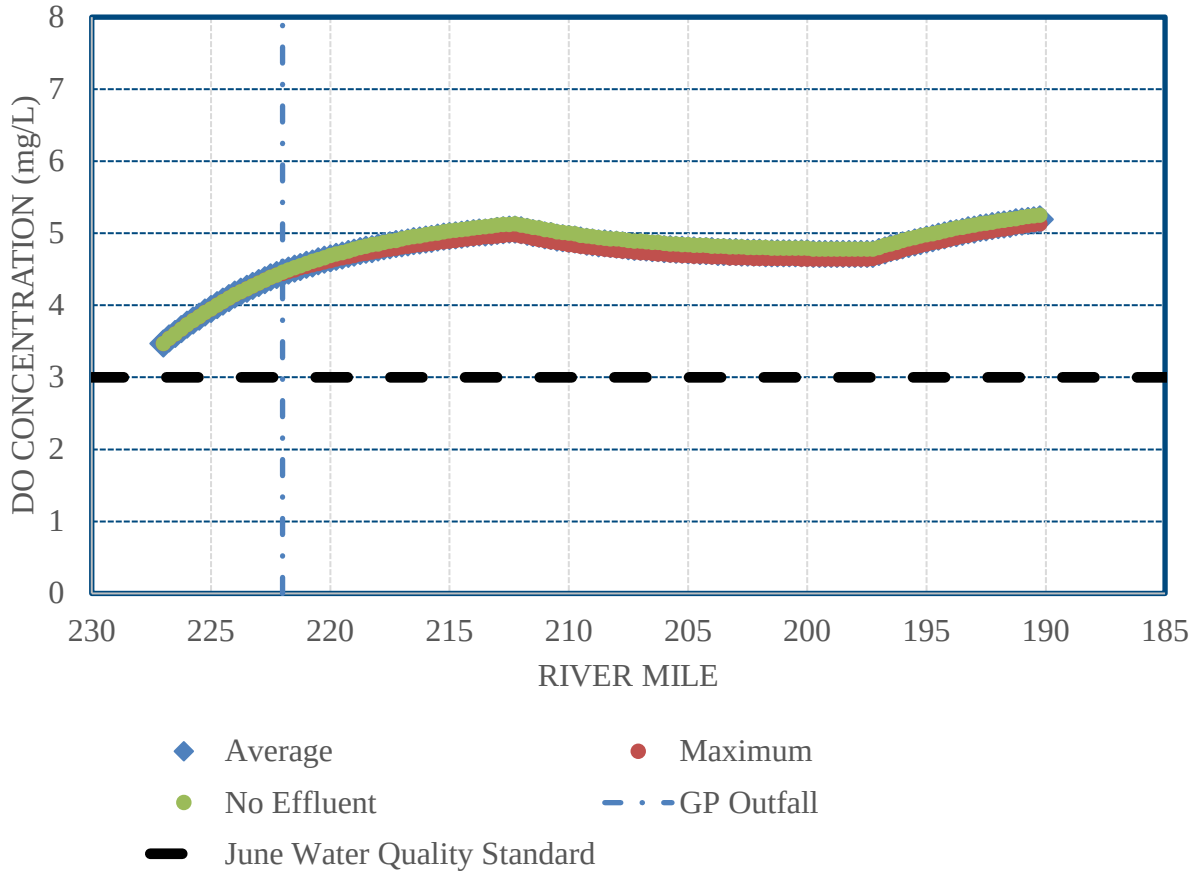
Table 11. Results of 65' Model Scenario

Parameter	Units	At Average Permit Loading	At Maximum Permit Loading
DO, as Maximum Difference from Model Prediction without Mill	mg/L	0.08	0.16
Predicted Copper Increase Downstream from Mill	µg/L	0.07	0.15

The copper results for both permit conditions are also presented in Table 11. When using a river background concentration of 1.24 µg/L, the resulting downstream copper concentration would be much less than the water quality standard for both

flood scenarios modeled. The copper water quality standards are 3.96 µg/L and 3.03 µg/L for the CMC and CCC, respectively.

Figure 11. Predicted DO for 65' Flood Scenario



75' Flood Scenario

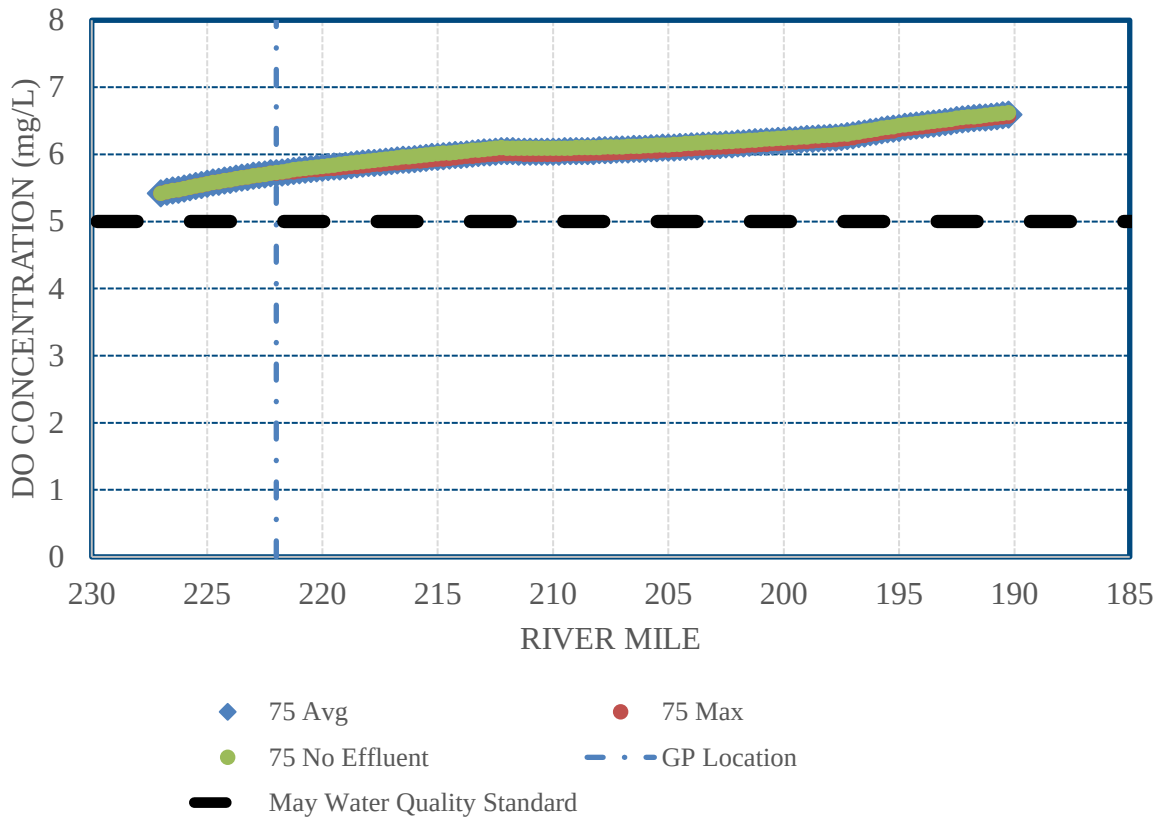
The results of the DO concentration at the 75' Flood Elevation are presented in Figure 12. A summary of the maximum delta DO concentration compared to the model run without the Mill's effluent is provided in Table 12. The difference in the DO concentration is within the accuracy of DO instrumentation, which is ±0.1 mg/L, which gives a potential swing of 0.2 mg/L.

The predicted copper results for both permit conditions are also presented in Table 12. When using a river background concentration of 1.77 µg/L, the resulting downstream copper concentration would be much less than the water quality standard for copper for both flood scenarios modeled. The copper water quality standards are 4.17 µg/L and 3.17 µg/L for the CMC and CCC, respectively.

Table 12. Results of 75' Model Scenario

Parameter	Units	At Average Permit Loading	At Maximum Permit Loading
DO, as Maximum Difference from Model Prediction without Mill	mg/L	0.05	0.09
Predicted Copper Increase Downstream from Mill	µg/L	0.03	0.05

Figure 12. Predicted DO for 75' Flood Scenario



CLOSING

We appreciate the opportunity to work with you on this matter. If you have questions or comments pertaining to this letter, please contact us by telephone at (615) 373-8532, by FAX at (615) 373-8512, or by e-mail at jmcorn@aquaeter.com or mcorn@aquaeter.com.

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 0.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

ALGAE GROWTH RATE	2	47
ALGAE GROWTH RATE	3	0
ALGAE GROWTH RATE	4	0

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

ALGAE GROWTH RATE	4	0

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

ALGAE GROWTH RATE 1 124
ALGAE GROWTH RATE 2 0
ALGAE GROWTH RATE 3 0

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

ALGAE GROWTH RATE	1	124
ALGAE GROWTH RATE	2	0
ALGAE GROWTH RATE	3	0

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

---

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

ALGAE GROWTH RATE 1 117
ALGAE GROWTH RATE 2 0
ALGAE GROWTH RATE 3 0

SUMMARY OF CONDITIONS FOR ALGAL GROWTH RATE SIMULATION:

1. LIGHT AVERAGING OPTION. LAVOPT= 2

METHOD: MEAN SOLAR RADIATION DURING DAYLIGHT HOURS

SOURCE OF SOLAR VALUES: DATA TYPE 1A
DAILY NET SOLAR RADIATION: 754.000 BTU/FT-2 (204.613 LANGLEYS)
NUMBER OF DAYLIGHT HOURS: 13.0
PHOTOSYNTHETIC ACTIVE FRACTION OF SOLAR RADIATION (TFACT): N/A
MEAN SOLAR RADIATION ADJUSTMENT FACTOR (AFACT): 0.920

2. LIGHT FUNCTION OPTION: LFNOPT= 2

SMITH FUNCTION, WITH 71% IMAX = 0.027 LANGLEYS/MIN

3. GROWTH ATTENUATION OPTION FOR NUTRIENTS. LGROPT= 1

MULTIPLICATIVE: FL*FN*FP

Contents

NED 1/3 Arc-second, 1 Arc-second, and 2 Arc-second Data Dictionary

Source Identification

DEMNAME
QUADNAME

DEMNAME

Data Name (text)

For projects used to produce the NED prior to March 31, 2014, this field indicates the name of the source DEM file.

For projects used to produce the NED after April 1, 2014, DEMNAME is the name of the original project that was adapted for incorporation into the 1/3, 1 and 2 arc-second NED layers. The format of this field will most commonly be three parts separated by underscores: PRIMARYSTATE, BRIEF-PROJECT-DESCRIPTION, YEAR.

QUADNAME

Quadrangle Name (text)

For DEMs derived from standard USGS paper map series, this is the name of the corresponding USGS quadrangle. This information may also be present in the first 40 characters of the FREETEXT field.

For new high resolution DEM source data, this field may be used in other ways.

Example QUADNAME = oak_island_MN

For DEMs introduced into the NED after April 1, 2014 this field will not be populated. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Source Production

PSITE
PMETHOD
PDEVICE
FREETEXT
RESOLUTION
HORIZ_M
S_DATE
I_DATE

PSITE

Production Site (text)

The site or party who created the source DEM for DEMs used to produce the NED prior to March 31, 2014.

Valid codes are:

UNKNOWN	Unknown
CONT	Contractor
MCMC	Mid-Continent Mapping Center
RMMC	Rocky Mountain Mapping Center
EMC	Eastern Mapping Center
WMC	Western Mapping Center
MAC	Mapping Applications Center
FS	Forest Service
USFS	Forest Service
BLM	Bureau of Land Management
NGTO	National Geospatial Technical Operations Center
AB	Alberta Sustainable Resource Development: Edmonton, Alberta, Canada
GDB	Center for Topographic Information, Geomatics Canada
NS	Nova Scotia Geomatics Center
NTDB	Center for Topographic Information Geomatics Canada: Ottawa, Ontario, Canada or Landscape Analysis - Canadian Forest Service: Sault Ste. Marie, Ontario, Canada
ON	Water Resources Information Program: Ottawa, Ontario, Canada
RS	Center for Topographic Information Geomatics Canada: Ottawa, Ontario, Canada
Z	Direction generale de l'information geographique, MRNF, Quebec, Canada
YT	Yukon Environment Information Management and Technology
BC	Base Mapping and Geomatic Services: Victoria, British Columbia, Canada
MULT	Multiple Canadian government agencies

For DEMs introduced into the NED after April 1, 2014 this field will be populated with the value UNKNOWN. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

PMETHOD

Production Method (short integer)

The method used to compile or capture the source DEM. For more information regarding PMETHODS see Digital Elevation Models (USGS, 1993).

Valid codes are:

0	Unknown
1	Electronic Image Correlation (specifically GPM II)
2	Manual Profiling
3	DLG2DEM
4	DCASS
5	LT4X
6	Complex polynomial interpolation, such as ANUDEM
7	Lidar
8	Photogrammetric mass points and break lines
9	Digital camera correlation
10	Ifsar
11	Other remote sensing technique

12 Topobathy

PDEVICE

Production Device (text)

The name of the instrument used to compile the source DEM. This field is of significance primarily to DEMs produced by manual profiling (PMETHOD = 2)

The current list of identified instruments is:

Wild A-7	Wild Autograph A7 - Mechanical Stereoplotter
Wild AG-1	Wild AG1 - Analytical Stereoplotter
OMI AS11A	OMI AS11A - Mechanical Stereoplotter
Wild B-8	Wild Aviograph B8 - Mechanical Stereoplotter
Wild BC-1	Wild BC1 - Analytical Stereoplotter
Wild BC-2	Wild BC2 - Analytical Stereoplotter
Zeiss C-8	Zeiss Stereoplanigraph C8 - Stereoplotter
Zeiss C100	Zeiss C100 Planicomp - Analytical Stereoplotter
GPM	Gestalt Photo Mapper II (GPM II)
KELSH	Kelsh - Optical Stereoplotter
Kern	PG-2 Kern PG-2 - Mechanical Stereoplotter
Wild	PPO-8 Wild PPO-8 Orthophoto Equipment (Used with Wild A8)
Santoni IIC	Santoni IIC - Analytical Stereoplotter
Galileo IIId	Galileo-Santoni Stereosimplex IIId
Jena Topocart B	Zeiss Jena Topocart B
Matra Traster	Matra Optique Traster - Photogrammetric Workstation
Helava US-2	Helava US-2 - Analytical Stereoplotter
CP100	Unknown, but appears to be a stereoplotter
CTOG	Contour to Grid Conversion
DCASS	Digital Cartographic Software System (USGS Software)
DLG	Digital Line Graph
LT4X	Either LT4X or LTPlus software
GDM COTS	DEM made by GeoDigital Mapping, Inc.
GTR COTS	DEM made by GTRSystems, Inc.
LT2000	Windows version of LT4X by Titan Systems, Inc.
SRTM	Shuttle Radar Topographic Mission
Unknown	Unknown
ADS40	Leica ADS40 Digital Camera

For DEMs introduced into the NED after April 1, 2014 this field will no longer be populated. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

FREETEXT

Free Text Description (text)

For DEMs derived from standard USGS paper map series, this field is first 136 bytes of the source DEM file, including the quadrangle name, free format text, and process field. This field may contain additional information, though there are no standards for the use of the free text field.

Example: NORTH CHINOOK RESERVOIR, MT -VDYA 1-09 9/06/75 WILD A-7 60000 4 -10915 0.0000 4845 0.00002

The contents of the FREETEXT field vary greatly from one DEM to the next, and in some cases are more confusing than helpful.

For DEMs introduced into the NED after April 1, 2014 this field will no longer be populated. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

RESOLUTION

Source Resolution (short integer)

This code indicates the planimetric (x, y) spacing of elevation postings within the source DEM. Note that all source data are resampled to a common resolution during NED production.

For DEMs used to produce the NED prior to March 31, 2014 valid values are:

0	Unknown
1	1 arc-second (Alaska, Canada, Mexico)
2	2 arc-seconds (1:100k series)
3	3 arc-seconds (1:250k series)
5	5 meters (non-standard data)
10	10 meters (7.5-minute series)
30	30 meters (7.5-minute series)
13	1/3 arc-second (non-standard data)
19	1/9 arc-second (non-standard data)

For DEMs introduced into the NED after April 1, 2014 the actual resolution of the original high-resolution source DEM will be populated in the HORIZRES_M field, and the RESOLUTION field will be populated with:

100	High-resolution source

HORIZRES_M

Horizontal Resolution of Source DEM (floating point)

The horizontal resolution (x, y) of the original DEM which was used to produce the NED, expressed in meters. Regardless of the source DEM horizontal units, this field is expressed in the common unit meters for more meaningful comparisons and simplified queries.

This is a new field in the spatial metadata shapefiles for DEMs used to produce the NED after April 1, 2014. For DEMs used to produce the NED prior to March 31, 2014, this field will be populated with -100.

S_DATE

Data Source Date (short integer)

For DEMs derived from standard USGS paper map series, this field is data element 21 in the source DEM Type A record, the date of original photography from which the DEM was compiled (Digital Elevation Models (USGS, 1993). This information was not provided with some standard DEMs with a native resolution of 30 meters.

In the case of high resolution source data, this field reflects the year that the base elevation data was collected, as in the case of LIDAR derived DEMs. For projects whose collection spanned more than one calendar year, this is the earliest acquisition year.

Format: YYYY

I_DATE

Data Inspection Date (short integer)

For DEMs derived from standard USGS paper map series, this field is data element 22 in the source DEMs Type A record: DEM Edit System (DES) inspection date (Digital Elevation Models, USGS, 1993). This information was not provided with some standard DEMs.

Format is either YYYY or YYMM

This field not used for newer, high-resolution data sources.

For DEMs introduced into the NED after April 1, 2014 this field be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Source Planimetric Descriptors

HDATUM
LRLAT
LRLON
ULLAT
ULLON
UTMZONE
XSHIFT
YSHIFT

HDATUM

Horizontal Datum (short integer)

Valid values:

0	Unknown
27	North American Datum of 1927 (NAD 27)
83	North American Datum of 1983 (NAD 83)
72	World Geodetic System of 1972 (WGS 72)
84	World Geodetic System of 1984 (WGS 84)
99	Other

LRLAT, LRLON, ULLAT, ULLON

Coordinates defining the minimum bounding box of the source DEM (floating point)
Units: decimal degrees. Coordinate System: NAD 83.

For DEMs derived from standard USGS paper map series, this field is derived from corner coordinates indicated in data element 11 of the DEMs Type A record (Digital Elevation Models USGS, 1993).

LRLAT Southern extent in latitude
LRLON Eastern extent in longitude
ULLAT Northern extent in latitude
ULLON Western extent in longitude

UTMZONE

Source UTM or State Plane Zone (short integer)

The projection zone of the source DEM.

If two digits, a UTM zone.

If four digits, a State Plane zone.

A value of zero in this field indicates that the source DEM is cast in geographic (lat/lon) coordinates.

For DEMs introduced into the NED after April 1, 2014 this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

XSHIFT, YSHIFT

Horizontal Shift (floating point)
Units: decimal degrees

The positional shifts in longitude and latitude, respectively, applied to each posting in the source DEM to convert from NAD27 coordinates to NAD83 coordinates. These values will be zero if the source DEM's HDATUM field value is 83, 84 or 72. (WGS84 is nearly identical to NAD83, and WGS72 is sufficiently similar that no shift was deemed necessary). The shift values were obtained from NGS's NADCON software, and were calculated at the nominal center of each quadrangle.

New high-resolution DEMs introduced into the NED after April 1, 2014 generally have a horizontal datum of NAD83 and this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Source Elevation Descriptors

VDATUM
ZUNIT
ZSTEP
ZSHIFT

VDATUM

Vertical Datum (short integer)

This code represents the vertical datum of source DEM.

Valid values are:

0	Unknown
1	Local Mean Sea Level
29	National Geodetic Vertical Datum of 1929 (NGVD 29)
88	North American Vertical Datum of 1988 (NAVD 88)
99	Other

ZUNIT

Elevation Unit (short integer)

This code represents the unit of elevation values in source DEM.

Valid values:

0	International Feet
1	Meters
2	U.S. Survey Feet
3	Decimal degrees
4	Centimeters
5	Inches
99	Other

ZSTEP

Elevation Resolution (floating point)
For DEMs derived from standard USGS paper map series, this field, together with ZUNIT, defines vertical resolution of the source DEM. Typical values are 1 and 0.1, though others are possible.

Example: ZSTEP = 0.1 This indicates that the source DEM records elevations to the nearest tenth of a meter.

A value of 0 is used when this field does not apply, as in the case of source data with floating point precision.

New high-resolution DEMs introduced into the NED after April 1, 2014 all have floating point precision, and this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

ZSHIFT

Elevation Shift (floating point)
The elevation shift, in meters, applied to each posting within the source DEM to convert to NAVD88 values. The shift values were obtained from NGS's VERTCON software, and were calculated at the nominal center of each quadrangle.

New high-resolution DEMs introduced into the NED after April 1, 2014 all have a vertical datum of NAVD88, therefore this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Source Elevation Summary Statistics

ZMIN
ZMAX
ZMEAN
ZSIGMA

Discussion: The summary statistics shown in these fields usually describe the entire source DEM, even when only some portion of the source DEM is used in NED, or when the source DEM is represented by more than one polygon within the metadata. These data are presented in common units (meters) and in a common vertical datum (NAVD88) to allow for more meaningful graphical displays and simplified queries.

ZMIN, ZMAX

Minimum and Maximum Elevation of Source DEM (floating point)

The minimum and maximum elevation values of the source DEM before any filtering or reprojection, but after conversion to meters and to NAVD88. For DEMs derived from standard USGS maps, subtracting ZSHIFT and converting to the DEM's original units results in the min and max values reported in data element 12 of the DEM's Type A record (Digital Elevation Models, USGS, 1993).

ZMEAN

Mean Elevation of Elevations in Source DEM (floating point)

The mean elevation value of the source DEM before any filtering or reprojection, but after conversion to meters and to NAVD88

ZSIGMA

Standard Deviation of Elevations in Source DEM (floating point)

The standard deviation of the elevations of the source DEM, before any filtering or reprojection, but after conversion to meters.

Source Accuracy Statistics

ABSX
ABSY
ABSZ
ABSPTS
RMSE
RMSEX
RMSEY

RMSEZ
RMSEPTS
VA_UNIT

ABSX, ABSY, ABSZ

Absolute Accuracy (short integers)
Absolute accuracy in X, Y, Z.

This field applies only to standard production USGS DEMs and echos data element 2 of the source DEM's Type C record,(Digital Elevation Models, USGS, 1993). See Standards for Digital Elevation Models for more information. This field is populated with zero if not available.

For DEMs introduced into the NED after April 1, 2014 this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

ABSPTS

Sample Size (short integer)

This field applies only to standard production USGS DEMs and echoes data element 3 of the source DEM's Type C (sample size record) (Digital Elevation Models, USGS, 1993).

For DEMs introduced into the NED after April 1, 2014 this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

RMSE

Availability of Relative Accuracy Statistics (short integer)

This field applies only to standard production USGS DEMs and echoes data element 4 of the source DEM's Type C (relative accuracy statistics) (Digital Elevation Models, USGS, 1993).

Valid codes:

1	Available
0	Not available

For DEMs introduced into the NED after April 1, 2014 this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

RMSEX, RMSEY, RMSEZ

Relative Accuracy (short integer)
This field applies only to standard production USGS DEMs and echoes data element 5 of the source DEM's Type C (relative accuracy in X, Y, Z (Digital Elevation Models, USGS, 1993).This field is zero if not available.

For DEMs introduced into the NED after April 1, 2014 this field will be populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

RMSEPTS

Sample Size (short integer)

This field applies only to standard production USGS DEMs and echoes data element 6 of the source DEM's Type C (sample size) (Digital Elevation Models, USGS, 1993).

For DEMs introduced into the NED after April 1, 2014 this field will populated with -100. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

NED Production Timestamps

QUADDATE

QUADDATE

Date the data were used to produce the NED (long integer)

The date on which the source DEM was first processed into NED. This field is particularly useful in the identification of recently updated areas.

Format: YYYYMMDD

NED1/9 Arc-second Data Dictionary

Source Identification

PROJ_NAME
DEMNAME

PROJ_NAME

Project name (text)

This field is the name of the original project that was adapted for incorporation into the NED 1/9 arc-second layer. The format of this field will most commonly be three parts separated by underscores: PRIMARYSTATE, BRIEF-PROJECT-DESCRIPTION, YEAR.

DEMNAME

Data Name (text)
The name of the final elevation dataset processed into a common coordinate system and units according to NED 1/9 arc-second specifications.

For DEMs introduced into the NED after April 1, 2014 this field will no longer be populated. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Source Production

RESOLUTION
HORIZRES_M
PMETHOD
S_DATE
FREETEXT

RESOLUTION

Resolution (short integer)

The planimetric (x, y), spacing of elevation postings of the final pre-processed datasets. Source LiDAR datasets resolution varies but is typically less than 3 meters. During NED 1/9 arc-second processing, source datasets are resampled to a common resolution (e.g. 1/9 arc-second or about 3 meters).

For DEMs used to produce the NED prior to March 31, 2014 valid values are:

19 1/9 arc-second (non-standard data)

For DEMs introduced into the NED after April 1, 2014 the actual source resolution is used in NED processing. The source resolution of the source data in meters of the original high-resolution source DEM will be populated in the HORIZRES_M field, and the RESOLUTION field will be populated with:

100 High-resolution source

HORIZRES_M

Horizontal Resolution of Source DEM (floating point)

The horizontal resolution (x, y) of the original DEM which was used to produce the NED, expressed in meters. Regardless of the source DEM horizontal units, this field is expressed in the common unit meters for more meaningful comparisons and simplified queries.

This is a new field in the spatial metadata shapefiles for DEMs used to produce the NED after April 1, 2014. For DEMs used to produce the NED prior to March 31, 2014, this field will not be populated.

PMETHOD

Production Method (short integer)

The method used to collect the original source elevation data. Valid codes are:

7 Lidar
10 Ifsar
11 Other remote sensing technique
12 Topobathy

S_DATE

Data Source Date (short integer)

The year the source elevation data were collected. If acquisition of a project spanned two or more calendar years, the earliest acquisition year is indicated in this field.

FREETEXT

Free Text Description (text)

There are no standards for the use of the free text field. This field may contain additional information to further describe the source project or clarify other metadata fields.

For DEMs introduced into the NED after April 1, 2014 this field will no longer be populated. Any values already in this field for DEMs used to produce the NED prior to March 31, 2014 are preserved.

Output Production

ZUNIT

ZUNIT

Elevation Unit (short integer)

This field describes the elevation units of the output 1/9 arc-second NED data. During the NED 1/9 arc-second processing, the source data vertical units are converted to a consistent elevation unit.

Valid value:

1	Meters

Source Accuracy Statistics

S_FVA
S_CVA
S_NVA
S_VVA
VA_UNIT
RMSEZ
RMSE_FVA
RMSE_SVA
RMSE_CVA

S_FVA

Source DEM Fundamental Vertical Accuracy (FVA) (floating point)

This is the tested FVA of the source resolution DEM. FVA, or $Accuracy_z$, is based only on points in clear and open terrain. The fundamental accuracy is the value by which vertical accuracy can be equitably assessed and compared among datasets. The S_FVA is calculated at the 95-percent confidence level as a function of vertical Root Mean Square Error (RMSE) i.e., $Accuracy_z = RMSE_z \times 1.96$.

S_FVA is expressed in the units reported in the VA_UNIT field.

Valid values:

-1	Not available
Other Values	Actual Calculated RMSE value

S_CVA

Source DEM Consolidated Vertical Accuracy (CVA) (floating point)

This is the tested CVA of the source resolution DEM. CVA is based on check points in all land cover categories combined. Error distribution for points in vegetated areas does not have a normal distribution. Therefore S_CVA is reported as the 95^{th} percentile.

S_CVA is expressed in the units reported in the VA_UNIT field.

Valid values:

-1	Not available
Other Values	Actual Calculated RMSE value

S_NVA

Non-vegetated Vertical Accuracy (floating point)

This field is reserved for future use.

Current valid value: -1

S_VVA

Vegetated Vertical Accuracy (floating point)

This field is reserved for future use.

Current valid value: -1

VA_UNIT

Vertical Accuracy Unit (short integer)

The units in which the vertical accuracy statistics are reported.

Valid values:

0	International Feet
1	Meters
2	US Survey Feet
3	decimal degrees
4	centimeters
5	inches
99	unknown

RMSEZ, RMSE_FVA, RMSE_SVA, RMSE_CVA

RMSE(z), RMSE(FVA), RMSE(SVA), RMSE(CVA) (double)

Vertical accuracy for source DEMs introduced into the NED after April 1, 2014 are reported in the S_FVA and S_CVA fields above.

Reported RMSE statistics are in meters.

RMSE(z): Root Mean Square Error of the elevation estimates.
RMSE(FVA): RMSE (Fundamental Vertical Accuracy).
RMSE(SVA): RMSE (Supplemental Vertical Accuracy).
RMSE(CVA): RMSE (Consolidated Vertical Accuracy).

RMSE is the square root of the average of the set of squared differences between dataset coordinate values and coordinate values from an independent source of higher accuracy for identical points.

$$RMSE_z = \text{sqrt}[\ \Sigma\ (Z_{\text{data I}} - Z_{\text{check I}})^2/n]$$

where $Z_{\text{data I}}$ is the vertical coordinate of the I_{th} check point in the elevation dataset, $Z_{\text{check I}}$ is the vertical coordinate of the I_{th} check point in the independent reference source of higher accuracy, n is the number of points being checked, and I is an integer from 1 to n.

The Fundamental Vertical Accuracy (FVA) of a dataset must be determined with check points located only in open terrain, where there is a very high probability that the sensor will have detected

the ground surface. The fundamental accuracy is the value by which vertical accuracy can be equitably assessed and compared among datasets. The FVA is calculated at the 95-percent Confidence Level as a function of vertical RMSE, i.e., $Accuracy_z = RMSE_z \times 1.9600$.

In addition to the fundamental accuracy, supplemental or consolidated accuracy values maybe calculated for other ground cover categories or for combinations of ground cover categories. Because elevation errors often vary with the height and density of ground cover, a normal distribution of error cannot be assumed and, therefore, RMSE cannot be used to calculate accuracy values. Consequently a nonparametric testing method (95th Percentile) is employed for supplemental and consolidated accuracy tests. The SVA or CVA are calculated at the 95^{th} percentile for each supplemental land cover category or combination of categories.

Valid values:

0	Not available
Other Values	Actual Calculated RMSE value

For DEMs introduced into the NED after April 1, 2014 theses RMSE fields will be populated with -100. Instead, accuracy statistics for these DEMs will be provided in the S_FVA and S_CVA fields or in the S_NVA and S_VVA fields above. Any values already in the RMSE fields for DEMs used to produce the NED prior to March 31, 2014 are preserved.

NED Production Timestamp

QUADDATE

QUADDATE

Date the data were used to produce the NED (long integer)

Format: YYYYMMDD

NED Original Product (Source) Resolution Data Dictionary

Source Identification

PROJ_NAME

PROJ_NAME

Source Project Name (text)

Project name is the name of the original source DEM project that was adapted for incorporation into the 1/9, 1/3, 1, or 2 arc-second NED layers. The NED Original Product Resolution production process maintains the coordinate reference system and horizontal units of the original project. However, vertical units are converted to meters.

The format of this field will most commonly be three parts separated by underscores: PRIMARYSTATE, BRIEF-PROJECT-DESCRIPTION, YEAR.

Source Production

PMETHOD
S_DATE

PMETHOD

Production Method (short integer)

The acquisition method used to collect the source elevation data (Digital Elevation Models, USGS, 1993).

Valid values are:

7	Lidar
10	Ifsar
11	Other remote sensing technique
12	Topobathy

S_DATE

Data Source Date (short integer)

The year the source elevation data were collected. If acquisition of a project spanned two or more calendar years, the earliest acquisition year is reported in this field.

Output Production

ZUNIT
REFSYS
HORIZRES
HORIZUNIT
FORMAT

HORIZRES_M

ZUNIT

Elevation Unit (short integer)

This field describes the elevation units of the output data. During the NED Original Product Resolution processing, the source data vertical unit is converted to consistent elevation unit, which is meters.

Valid value:

1 Meter

REFSYS

Coordinate Reference System (text)

This field describes the coordinate reference system and projection of the NED Original Product Resolution DEM.

HORIZRES

Horizontal Resolution (floating point)

The horizontal resolution (x, y) of the NED Original Product Resolution DEM. The value is reported in the units recorded in the HORIZUNIT field.

HORIZUNIT

Horizontal Resolution Units (short integer)
The unit in which the horizontal resolution, HORIZRES, is reported.

Valid values:

0 International Feet
1 Meters
2 U.S. Survey Feet
3 Decimal Degrees
4 Centimeters
5 Inches
99 Unknown

FORMAT

Raster File Format (short integer)
The raster file format of the Original Product Resolution DEM.

Valid values:

1 IMG
2 ArcGrid
3 GridFloat
4 Tiff

5 Other

HORIZRES_M

Horizontal Resolution Expressed in Meters (floating point)

The horizontal resolution (x, y) of the Original Product Resolution DEM expressed in meters. This field is provided for easy comparison of and sorting of horizontal resolutions, regardless of the horizontal units of the actual DEM.

Accuracy Statistics

FVA
CVA
NVA
VVA
VA_UNIT

FVA

Fundamental Vertical Accuracy (FVA) (floating point)

This is the tested FVA of the source resolution DEM. FVA, or $Accuracy_z$, is based only on points in clear and open terrain. The fundamental accuracy is the value by which vertical accuracy can be equitably assessed and compared among datasets. The FVA is calculated at the 95-percent confidence level as a function of vertical Root Mean Square Error (RMSE) i.e., $Accuracy_z = RMSE_z \times 1.96$.

FVA is expressed in the units reported in the VA_UNIT field.

Valid values:

-1	Not available
Other Values	Actual Calculated RMSE value

CVA

Consolidated Vertical Accuracy (floating point)

This is the tested CVA of the source resolution DEM. CVA is based on check points in all land cover categories combined. Error distribution for points in vegetated areas do not have a normal distribution. Therefore S_CVA is reported as the 95^{th} percentile.

CVA is expressed in the units reported in the VA_UNIT field.

Valid values:

-1	Not available
Other Values	Actual Calculated RMSE value

Appendix A

Correspondence between selected NED metadata items and USGS DEM Type A records.

Refer to Data User's Guide 5, Appendix A, for complete descriptions of the A record data elements referenced below.

FREETEXT The FREETEXT field is a literal copy of Data Element 1: The first 140 bytes of the A record. By USGS definition, only bytes 41 through 80 are free format text, but this restriction is not commonly observed.

PSITE This is a literal copy of data element 2, the Mapping Center origin code. If this field is blank, the code "UNKNOWN" is assigned to PSITE.

ZONE This is a literal copy of data element 6.

ZUNIT This field is derived from data element 9, but does not use the same values. Data element 9 is coded as 1 = feet, 2 = meters. ZUNIT, however, is coded as 0 = feet, 1 = meters.

LRLAT, LRLON, ULLAT, ULLON These fields are derived from data element 11.

RESOLUTION This field is derived from data element 15, which indicates the *x*, *y*, and *z* resolutions of the source DEM. In the case of Alaska data, where x and y resolutions differ, the y resolution is taken to be the resolution of the DEM. Further, RESOLUTION is indicated in the DEM's native units (meters or decimal seconds). Nonstandard DEM's may be assigned RESOLUTION values in a different manner.

ZSTEP This is a literal copy of the *z* resolution component of data element 15.

S_DATE This is a literal copy of data element 21, or 0 if data element 21 is absent.

I_DATE This is a literal copy of data element 22, or 0 if data element 22 is absent.

HDATUM This field is derived from data element 27, but uses different values. Data element 27 specifies unique codes for the Old Hawaii Datum and the Puerto Rico Datum, both of which are designated as 27 in HDATUM.

VDATUM This field is derived from data element 26, but uses different values. A value of 0 is assigned to VDATUM if no vertical datum information is present.
