**RE: Submittal of First Half 1996 Statistical Evaluation Report for the
Sunray/USA Waste Tontitown Class I Sanitary Landfill, Permit No.
162-SR-2.**

Dear Dave Ann:

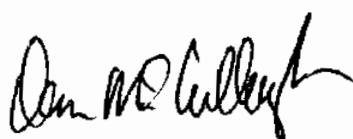

On behalf of Sunray/USA Waste, Genesis Environmental Consulting, Inc. (GEC) is pleased to submit a copy of the First Half 1996 Statistical Evaluation Report for the Tontitown Class I Sanitary Landfill.

If you have any questions concerning the subject report, please feel free to contact Dan McCullough or myself.

Sincerely,
GENESIS ENVIRONMENTAL CONSULTING, INC.

Steve Jett
Staff Geologist

1.0 INTRODUCTION

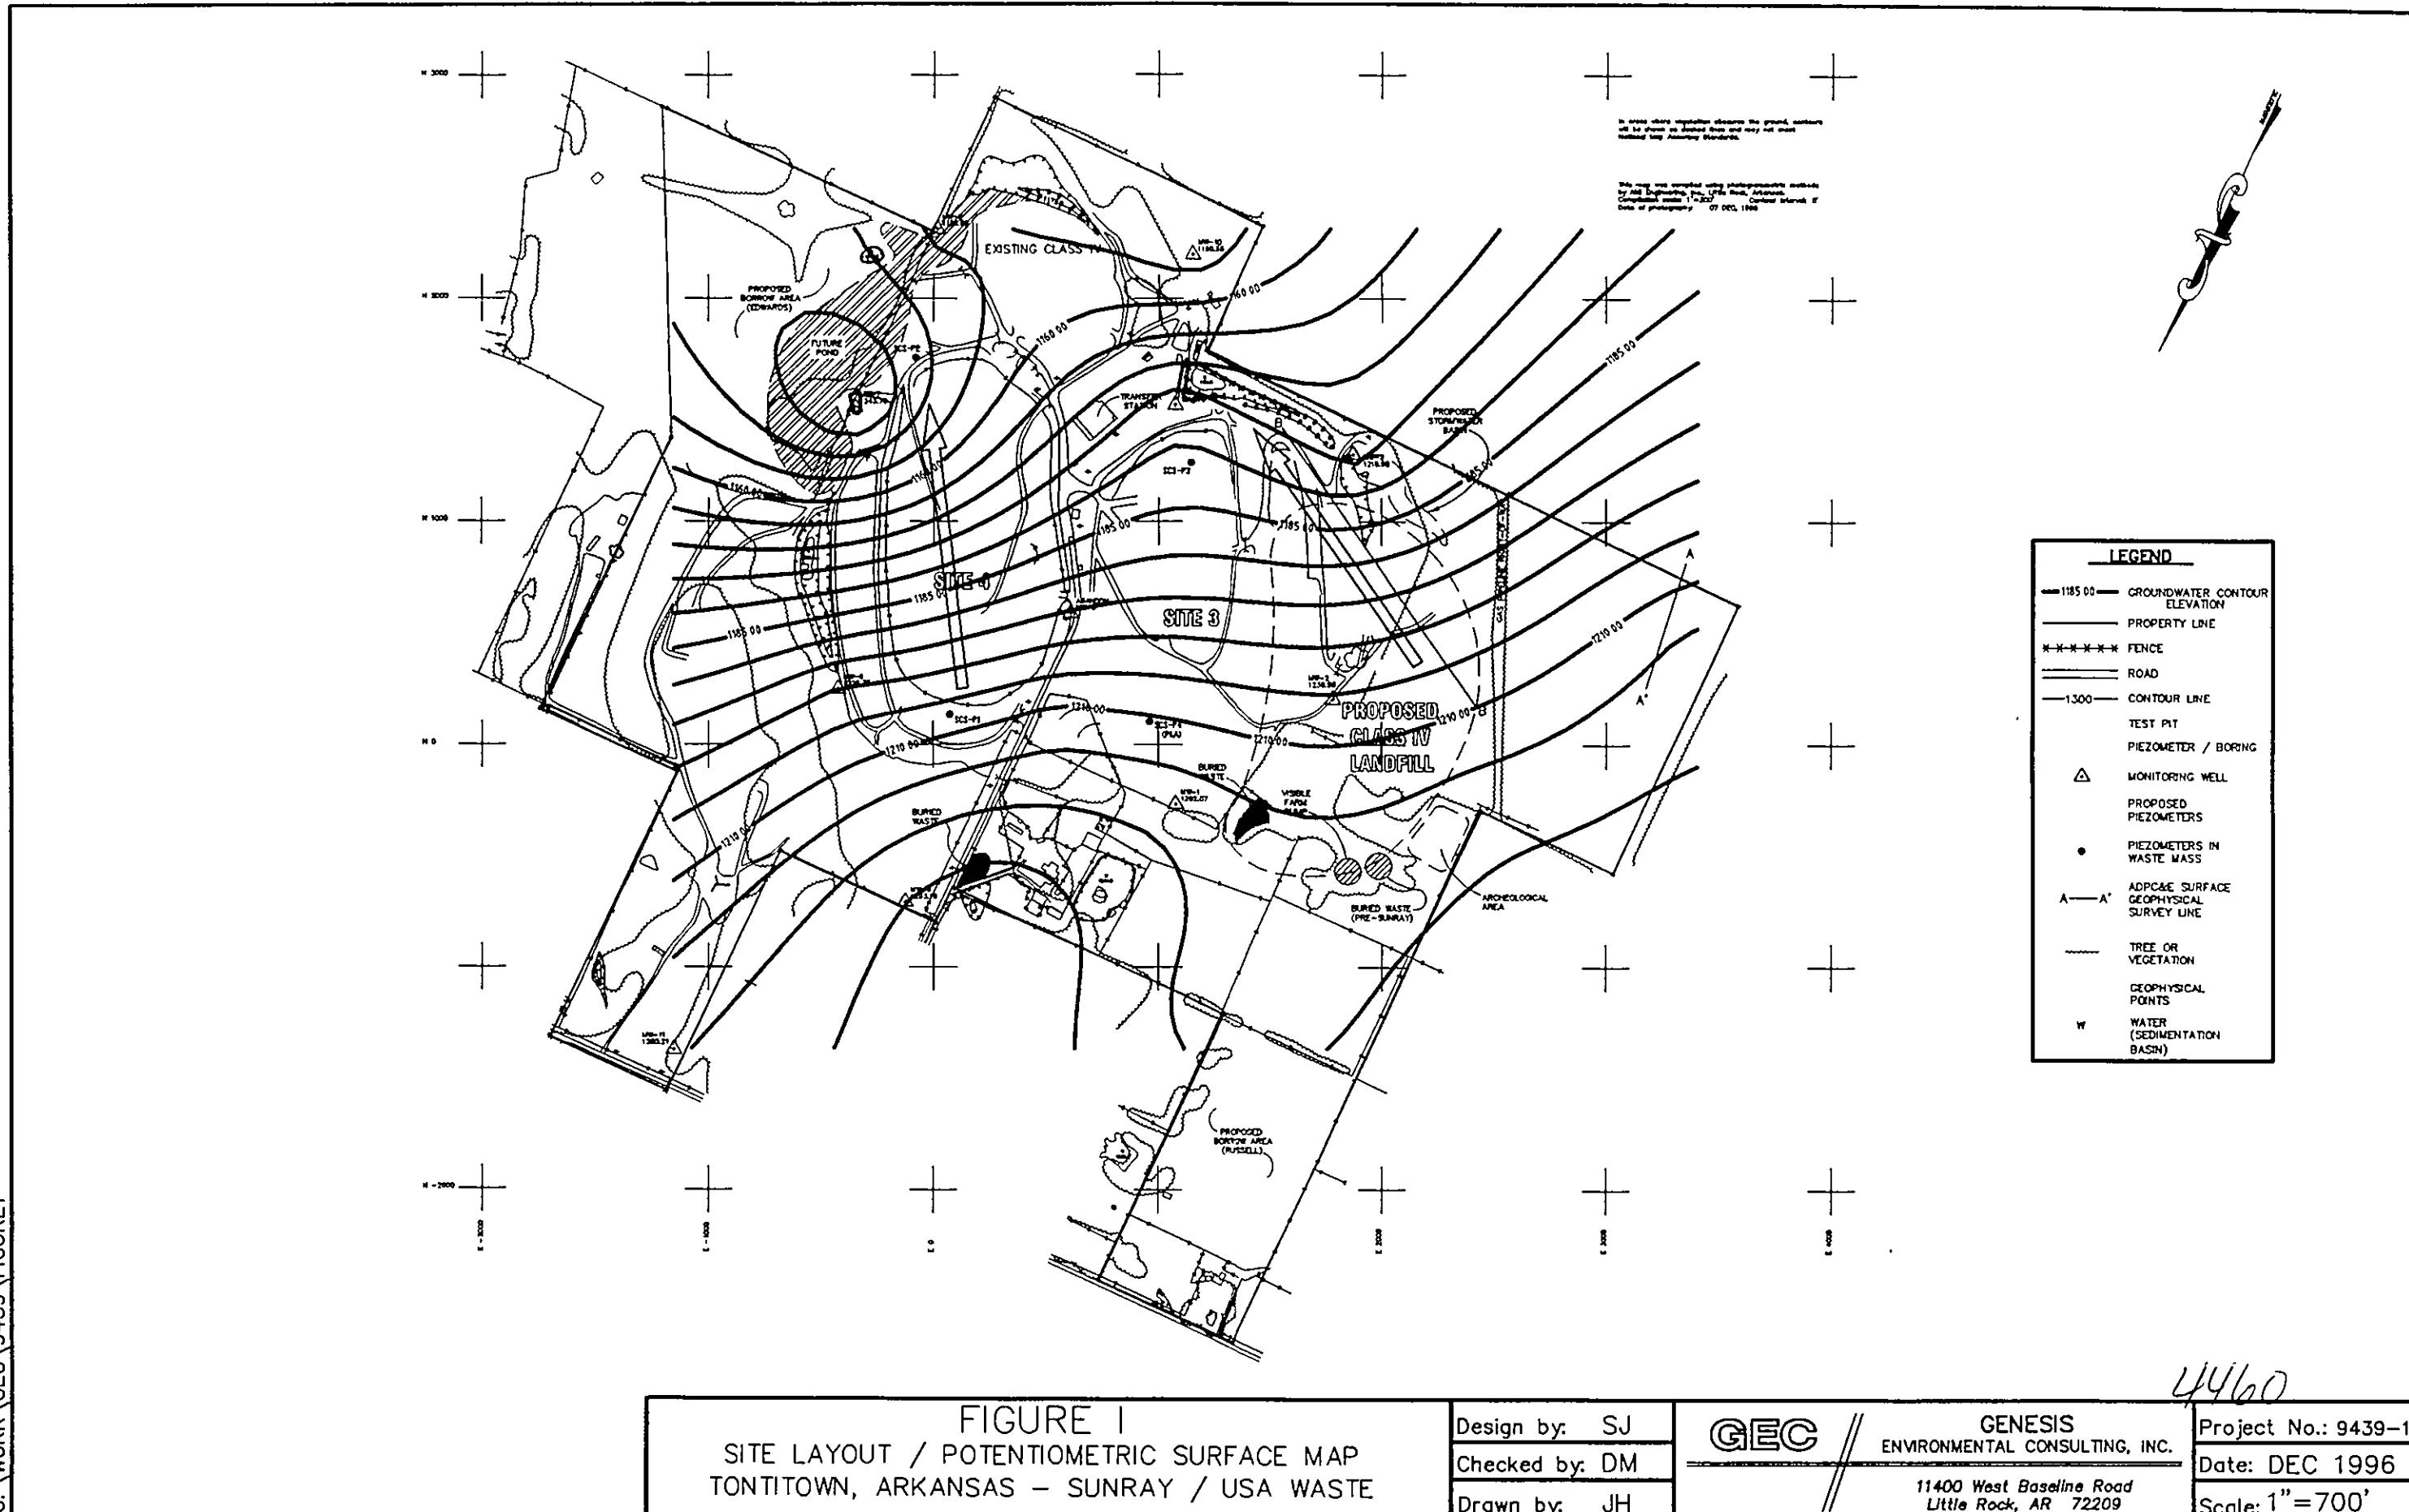

Sunray Services, Inc. (Sunray) operates a Class I Municipal Solid Waste Landfill under Solid Waste Permit Modifications 123-SR-2 and 162-SR-2 issued by the Arkansas Department of Pollution Control and Ecology (ADPC&E) on September 20, 1991. The ten monitoring wells at the Sunray Landfill (located near Tontitown, Arkansas) have been monitored in accordance with condition Number 20 of Permit Modification 162-SR-2. FIGURE 1 presents a site layout and potentiometric surface map.

1.1 CURRENT SITUATION

Sunray is currently operating an approved groundwater monitoring system under the "Assessment Monitoring Program" provisions of 40 CFR 258.55. Sunray began their Assessment Monitoring Program based on the results of the Third Quarter 1994 Groundwater Report dated January 11, 1995. A February 13, 1995 letter from Genesis Environmental Consulting, Inc. (GEC) on behalf of Sunray to Arkansas Department of Pollution Control and Ecology (ADPC&E), and a response letter from ADPC&E to Sunray dated February 27, 1995 outline the details of the program. The following provides a brief summary of the Assessment Monitoring Program and the current status:

Step 1: "In addition to the Appendix I and permit parameters Sunray will sample for the Appendix II constituents in Well 1 during the regularly scheduled March (1995) sampling event". It should also be noted that ADPC&E added MW-4, 5, 6, and 7 to the assessment monitoring program when the contingency plan was approved.

Step 2: "Sunray will analyze for all Appendix II parameters detected in Well 1 (and Wells 4, 5, 6, 7) during the next 4 regularly scheduled sampling events (June 1995, September 1995, December 1995, and March 1996)". Sunray completed this step for all the required wells but had to start over because the analytical laboratory utilized by Sunray was invalidated by the ADPC&E. It must be noted that all of the Appendix II parameters that were detected (with the exception of two phthalate compounds which were attributed to laboratory or sampling influence) were already on the Appendix I list as well.

Step 3: "Sunray will establish a statistical background and groundwater protection standard for the detected Appendix II parameters in Well 1 (and Wells 4, 5, 6, 7) as specified in 40 CFR 258.55(c)(3)&(4). This step will be completed prior to April of 1996". Sunray did not detect any additional Appendix II parameters in any of the wells other than the previously reported Appendix I volatiles. However, Sunray must establish background and groundwater protection standards for the detected volatiles, because the Appendix I volatiles are on the Appendix II list. Sunray will be in the position of establishing both the background and the groundwater protection standard for these parameters.

Step 4: "Sunray will then sample for the Appendix I and detected Appendix II parameters in Well 1 (and Wells 4, 5, 6, 7) during the June 1996 and September 1996 sampling events. If these parameters are at or below background values during these sampling events, Sunray will return to detection monitoring (258.55(e)). If the concentrations are above background values but are below the groundwater protection standard the assessment monitoring will continue (258.55(f)). If one or more of the constituents are detected at statistically significant levels above the groundwater protection standard, Sunray will proceed according to 258.55(g)".

The approved contingency plan was to be exercised by September of 1996 to the point of either: 1.) Returning to Detection, 2.) Remaining in Assessment, or 3.) Going to Corrective Action. This modified contingency plan is in compliance with 40 CFR 258, Subtitle D. ADPC&E declared all data from Sunray's laboratory invalid between January to October 1995. Therefore, Sunray completed Step 1 in March of 1996. Sunray will complete Step 2 in March 1997 and Step 3 in April of 1997. The final determination of Step 4 will be September of 1997.

This report summarizes the tenth sampling event at the Landfill for the current list of parameters. As outlined above, this report is intended to provide a brief summary of the current Assessment Monitoring and statistical status. [redacted] Statistical data presented in this report cover the first half of 1996 which constitute the first two background assessment monitoring events.

A detailed groundwater monitoring report will be submitted following the fourth background assessment monitoring event. At that time, it will be determined if Sunray will be: 1.) Returning to Detection, 2.) Remaining in Assessment, or 3.) Going to Corrective Action.

2.0 FIRST HALF 1996 STATISTICAL EVALUATION

The statistical evaluation described in this report covers all historical data from April, 1993 to June, 1996 for a total of ten sampling events. Summary tables of all historical data and statistical evaluations are presented in the Appendices A, B, and C.

2.1 DEVELOPMENT OF GROUNDWATER MONITORING SYSTEM

In order to properly evaluate the historical groundwater monitoring data, an understanding of the development of the monitoring system is required. The following provides a brief history of the development of the groundwater monitoring system.

- On 8/11/86, CAO #86-010 and 86-008 required the installation of a groundwater monitoring system at the Sunray Tontitown site. It was at this point that Sunray installed monitoring wells MW-1 through MW-9. (See FIGURE 4).
- An April 23, 1990 letter to Sunray from Mr. Harry Elliot of ADPC&E, required that the list of parameters be expanded to include those parameters included in 40 CFR Part 136. Even though this list is not the list of parameters to be monitored under "Subtitle D", the list of parameters included volatiles and semi-volatiles, some of which are also found in the Appendix I list to 40 CFR 258.
- As outlined in Permit Modification 123-SR-2 and 162-SR-2 dated September 20, 1991, Sunray conducted a hydrogeologic investigation at the Tontitown site. Based on results from this investigation, monitoring wells MW-10 and MW-11 were added to the system, MW-9 was plugged and abandoned, and MW-3, MW-4, and MW-7 were replaced. Sunray received a letter from Tom Boston of ADPC&E dated 11/7/91 that conditionally approved this system.
- Based on the conditional approval, Sunray established their groundwater monitoring system to comply with Subpart E of 40 CFR 258 and began monitoring the system for the parameters listed in 40 CFR 258 Appendix I on April 7, 1993 on a quarterly basis as required in the permit.
- In May, 1994, Sunray replaced monitoring well MW-4 due to suspected problems with the installation.

It should be noted that Sunray is currently completing a detailed Hydrogeologic Investigation at the Tontitown Site. It is possible that based on the outcome of this investigation, that the groundwater monitoring system may be revised.

2.2 GROUNDWATER ELEVATION AND FLOW DIRECTION

There are currently ten monitoring wells located around the Landfill area. Water level elevations have been collected from each of the wells historically since 1988. From the results of this evaluation, monitoring wells MW-1, MW-2, MW-5, and MW-11 are considered upgradient of the Landfill unit. Presented as FIGURE 1 is a site layout/potentiometric surface map. Although this hydraulic gradient and flow direction has been historically constant, it should be noted that the Landfill is located over a carbonate aquifer. Groundwater monitoring systems located in carbonate aquifers are sometimes dominated by conduit flow as opposed to porous media flow. In aquifers dominated by conduit flow, subsurface conduits are the primary pathways that contaminant releases follow. In this situation, intercepting conduits connected to the Landfill with wells is critical. ~~Sunray Landfill is located over a carbonate aquifer, and opinions vary as to the groundwater flow conditions, an upgradient to downgradient relationship (inter-well) was not considered for statistical evaluation purposes. Further discussion will be presented later in this document.~~

2.3 GROUNDWATER QUALITY

APPENDIX A presents the analytical results of the groundwater quality analyses since April, 1993 when "Subtitle D" groundwater monitoring began. The data presented in APPENDIX A was derived from the SANITAS V.6 statistical program. This data was utilized to determine if increasing trends exist, and to statistically determine if there exist significant increases at each individual monitoring well for each of the permitted water quality parameters.

APPENDIX B contains an example of a typical statistical evaluation for a parameter that was sampled during the last event. It was impractical to present all statistical evaluation data generated by SANITAS due to the large volume of reports generated by the intra-well analysis. Copies of the printed statistical reports can be obtained from GEC.

The analytical results presented in APPENDIX A include both the method detection limit (MDL) and practical quantitation limit (PQL) for each of the Appendix I parameters. The historical values presented in APPENDIX A, utilize the MDL for reported non-detect values. The MDL is defined as the minimum concentration of a substance that can be measured and reported with 99%

confidence that the value is above zero. The PQL is the lowest concentration of analyte in groundwater that can be reliably determined within specified limits of precision and accuracy by the indicated methods under routine laboratory operating conditions.

Values reported by the laboratory that were between the MDL and PQL were included in this report to identify those parameters that need to be monitored closely in the future for possible indication of contamination. However, as specified in 40 CFR 258.53 (h) (5) and ADPC&E Regulation Number 22 Section 22.1203 (h) (5), the PQL was used in statistical evaluations due to the fact that this value is the lowest concentration level that can be reliably achieved with the specified limits of precision and accuracy reported by the laboratory. For statistical purposes, all values reported to be above the MDL but below the PQL, were considered to be non-detect at the reported PQL level.

2.4 STATISTICAL EVALUATIONS

The statistical methods used to evaluate the data for statistically significant differences were based on statistical procedures outlined in the "Statistical Analysis of Ground-Water Monitoring Data at RCRA Facilities", interim final guidance document, USEPA, February 1989 (RCRA Guidance Document) and the July, 1992 Addendum to this document. The EPA recommended statistical methods were followed utilizing the software package SANITAS Version 6.0 A description of the decision process and the procedures that were used in the statistical evaluation follows.

Step 1. Calculate Proportion of Non-Detects.

The proportion of non-detects in the data set for each constituent was calculated as the number of quantitated non-detect values divided by the total number of samples analyzed for that constituent. This calculation was made separately for each constituent.

Step 2. Select Between ANOVA, Prediction or Tolerance Interval or Comparison with Standard.

If the proportion of non-detects in the data set for a particular constituent is greater than 90%, then the quantitated values are directly compared to an MCL, the background concentration determined during background monitoring, or a health-based groundwater concentration calculated using current toxicological data and assumptions outlined in the RFI Guidance Document.

If the proportion of non-detects was found to fall below 90% but above 15%, parametric statistical intervals were abandoned in favor of non-parametric alternatives. Each non-detect value was replaced with one half the detection limit and GEC proceed with a modified intra-well comparison.

Step 3. Normality of the Data Set

The hypothesis tests with a Parametric Analysis usually assume that the data are normally distributed with constant variance. These assumptions can be checked by using the test of assumptions. One simple check that can determine if data is normally distributed is to construct a Probability Plot of the data. The y-axis is scaled to represent probabilities according to the Normal distribution and the data are arranged in increasing order.

An observed value is plotted on the x-axis and the proportion of observations less than or equal to each observed value is plotted as the y-coordinate. The scale is constructed so that if the data are Normal, the points when plotted will approximate a straight line. Visually apparent curves or bends indicate that the data do not follow a Normal distribution. A logarithmic transformation will then be performed on the data and the data will be replotted. In most cases this will normalize the data. However, in the event it does not, a Non-parametric method was used.

If the Probability Plot of the data indicates an approximate straight line, a second test of normality will be performed. The recommended test in the 1992 Addendum to the Guidance Document is the Shapiro-Wilk test. This test is referenced as being one of the very best tests of Normality available.

2.5 INTRA-WELL COMPARISONS

~~After much consideration~~ it was determined that a Intra-Well Predication interval method would be utilized. The problem with this statistical method is that these charts are based upon the mean and standardized deviation of the background data.

The lack of quality background data was a hindrance in all of the statistical procedures. It was determined that the method least likely to give false negatives and positives would be the Predication Interval method.

However, a modification to the method was needed to provide data for the basis of the analysis. The analysis is based on a comparison to a mean and standard deviation which is usually taken from the background population. Since the "Subtitle D" groundwater monitoring began in April, 1993 with the installation of

the approved system, baseline data had to be taken during a period of Landfill operation. The statistical evaluations presented in this report are based on a mean and standard deviation calculated from the first four quarterly sampling events (4/07/93 - 11/30/93) following the approval of the groundwater monitoring system. These charts provide an analysis of water-quality trends since 4/07/93. Several examples of the Prediction Interval analysis are included in APPENDIX C.

2.6 RESULTS OF THE STATISTICAL EVALUATION

As presented on the summary tables in APPENDIX B, and the charts in APPENDIX C, based on a comparison to the first four sampling events taken from the approved groundwater monitoring system (April, 1993 - November, 1993), statistically significant increases, were calculated for two volatile parameters in Monitoring Well MW-1. These parameters were 1,1 Dichloroethane, and 1,4 Dichlorobenzene. As indicated in APPENDIX A, reported concentrations at MW-1 have been increasing since April, 1993 for these parameters. It should be noted, that monitoring well MW-1 is located in a hydraulically upgradient location. Although potentiometric surface maps are not always accurate in carbonate aquifers, there is the possibility that the source of the trend in MW-1 is due to another source other than the Landfill. Sunray plans to monitor this situation closely in the future and possibly define a source for this trend. Recent investigations have identified several possible upgradient sources for these parameters.

3.0 CONCLUSIONS

Based on the results of the historical groundwater monitoring data from April, 1993 to June, 1996, the following conclusions were made:

From the review of the groundwater elevations, the groundwater is flowing in a south - southeasterly direction. MW-1, MW-2, MW-5, and MW-11 appear to be upgradient from the Landfill. The interpretation of the hydraulic gradient is contingent upon the assumption that all the wells are completed in the same aquifer. Sunray is currently completing a detailed hydrogeologic investigation. One of the major objectives of this study is to gain a better understanding of the groundwater flow conditions through the use of slug tests, pump tests and dye tests.

The statistical evaluation for this event was performed on all historical data following the approval of the "Subtitle D" monitoring system. Each parameter contained quarterly data from April, 1993 to September 1, 1994. As stated in Section 2.5, a modified prediction interval method was based upon analytical results from the first four sampling events at each individual well.

Based on a comparison to the first four sampling events taken from the approved groundwater monitoring system (April, 1993 - November, 1993), statistically significant increases, were calculated for 1,1 Dichloroethane, and 1,4 Dichlorobenzene in monitoring well MW-1. This monitoring well is hydraulically upgradient of the Landfill but located near the Landfill limits. In addition, several possible upgradient sources have been identified during the recent investigation.

The Maximum Contaminant Level (MCL) of 2 ug/l was exceeded in monitoring wells MW-1, MW-3, and MW-4 for vinyl chloride. However, based on the statistical evaluation, with the exception of 1,1-Dichloroethane and 1,4, Dichlorobenzene, all detected volatile organic parameters were not found to have significantly increase from the first four sampling events of the "Subtitle D" monitoring system. This indicates that the majority of the detections are either at: low concentrations, have stabilized, or are decreasing.

Based on the results of the recent hydrogeologic investigation, it is believed that the presence of volatiles in the monitoring wells could be caused by the wells being too close to the waste mass. It should be noted, Sunray has purchased additional land adjacent to the Landfill and along the point of compliance since the original monitoring system was installed. A revised monitoring system may be proposed in the Hydrogeologic Investigation Report which will be submitted to ADPC&E in December, 1996.
