Re: Chambers - Tontitown Landfill (70110.01)

Dear Mr. Dae:

Enclosed is our report on the analysis of five water samples collected for the Chambers - Tontitown Landfill project on 28 March 1996. The invoice is included.

Please contact me if you have any questions or require further information and refer to report 960424. Unless other arrangements are made, we reserve the right to dispose of your samples sixty (60) days from the date of this letter. We will retain the raw data for seven years from this date.

Sincerely,

R. Thomas Randall
Laboratory Project Manager

enclosure

I. NARRATIVE

**EA Laboratories
ANALYTICAL NARRATIVE**

Client **Chambers USA**
Site: **Tontitown Landfill**
Project number **70110.01**

EA Laboratories Report: **960424**
Laboratory Project Manager: **R. Thomas Randall**
Report Date: **3 May 1996**

This report contains the results of the analysis of five water samples collected on 28 March 1996 in support of the referenced project.

SAMPLE RECEIPT

The samples and one trip blank arrived by Federal Express at EA Laboratories on 29 March 1996. Upon receipt, the samples and blank were inspected and compared with the chain-of-custody record. The samples and blank were then logged into the laboratory computer system with assigned laboratory accession numbers and released for analysis.

| <u>Client Sample Designation</u> | <u>EA Lab Number</u> |
|----------------------------------|----------------------|
| MW-05 | 9603768 |
| MW-06 | 9603769 |
| MW-07 | 9603770 |
| MW-01 | 9603771 |
| MW-04 | 9603772 |
| TRIP BLANK | 9603773 |

Following this narrative section are a description of analytical methods used (Table 1), data qualifiers (Table 2), and the original chain-of-custody. Analytical results and quality control information are summarized in the appended data package which has been formatted to be consistent with the deliverable requirements of this project.

QUALITY CONTROL

The following sections are ordered as the data appears in this report. They contain observations made during sample analysis, summarize the results of quality control measurements, and address the impact on data usability based upon project Data Quality Objectives. For each fractional analysis the narrative includes:

- Sample chronology. This section summarizes the sample history by fraction including the sample preparation method and date, analytical method, and analysis date. Anything unusual about the samples, digestates, or extracts is identified. Holding time compliance is evaluated in this section.
- Laboratory method performance. All quality control criteria for method performance must be

EA Laboratories
ANALYTICAL NARRATIVE

Client: **Chambers USA**

Report Date: **3 May 1996**

met for all target analytes for data to be reported. These criteria generally apply to instrument tune, calibration, method blanks, and Laboratory Control Samples (LCS). In some instances where method criteria fail, useable data can be obtained and are reported with client approval. The narrative will then include a thorough discussion of the impact on data quality

- **Sample performance:** Quality control field samples are analyzed to determine any measurement bias due to the sample matrix based on evaluation of matrix spikes (MS), matrix spike duplicates (MSD), and laboratory duplicates (D). If acceptance criteria are not met, matrix interferences are confirmed either by reanalysis or by inspection of the LCS results to verify that laboratory method performance is in control. Data are reported with appropriate qualifiers or discussion

VOLATILES by GC/MS - WATER (EA9603768 - EA9603773)

Sample Chronology: The samples were analyzed by USEPA SW-846 methods 5030/8260 on 8 April through 9 April 1996 for the Appendix II analyte list. All specified holding times were met.

Laboratory Method Performance: All laboratory method performance criteria were met for the reported samples.

Sample Performance: All quality control criteria were met for the reported samples

SEMIVOLATILES by GC/MS - WATER (EA9603768 - EA9603772)

Sample Chronology: The samples were extracted by SW-846 method 3520 on 4 April 1996. The sample extracts and the associated quality control samples were analyzed by SW-846 method 8270 on 17 April and 18 April 1996 for the Appendix II analyte list. The samples were extracted and analyzed within method specified holding times

The matrix spike and matrix spike duplicate associated with this extraction batch were performed on another client's sample. Data and results for the reference field sample, the matrix spike, and the matrix spike duplicate have been kept on file at the laboratory.

Field sample MW-04 was re-extracted outside of holding time on 19 April 1996 by SW-846 method 3520 due to low (<10%) acid surrogate recoveries in the initial extract. The re-extract of this sample was analyzed by SW-846 method 8270 on 30 April and 1 May 1996. Data and results for both analyses have been included in this report

All other samples were re-extracted outside of holding time on 24 April 1996 by SW-846 method 3520 because the laboratory control sample (LCS) associated with the initial extraction yielded low recoveries for several analytes. The re-extracts were analyzed by SW-846 method 8270 on 30 April and 1 May 1996. Data and results for both analyses of all samples have been included in this

EA Laboratories
ANALYTICAL NARRATIVE

Client: Chambers USA
Site: Tontitown Landfill
Project number: 70110.01

EA Laboratories Report: 960424
Laboratory Project Manager: R. Thomas Randall
Report Date: 3 May 1996

report. No matrix spike or matrix spike duplicate was extracted with this re-extraction batch due to insufficient sample volume. However, a duplicate laboratory control sample was extracted and analyzed with these samples.

Laboratory Method Performance: The laboratory control sample associated with the initial extraction had the recoveries for acenaphthene (53%), n-nitroso-di-n-propylamine (64%), pyrene (58%), and 1,2,4-trichlorobenzene (40%) below the lower laboratory quality control limits of 57%, 67%, 64%, and 47%, respectively. These low recoveries may indicate a negative bias for these analytes.

The laboratory control sample associated with the re-extraction on 19 April 1996 had the recoveries for 4-nitrophenol (89%) and pentachlorophenol (92%) above the upper laboratory quality control limits of 85% and 91%, respectively. These recoveries may indicate a positive bias for these analytes; however, since no target analytes were detected in MW-04RE, data usability should not be impacted.

The first laboratory control sample associated with the re-extraction on 24 April 1996 had the recoveries for 2-chlorophenol (88%), 4-nitrophenol (95%), pentachlorophenol (98%), and 1,4-dichlorobenzene (78%) above the upper laboratory quality control limits of 84%, 85%, 91%, and 73%, respectively. The second laboratory control sample associated with the 24 April 1996 re-extraction had the recoveries for 4-nitrophenol (88%) and pentachlorophenol (92%) above the upper laboratory quality control limits of 85% and 91%, respectively. These recoveries may indicate a positive bias for these analytes (1,4-dichlorobenzene was detected in MW-01RE). None of these analytes were detected in any of the other re-extracted samples, therefore, data usability should not be impacted.

All other laboratory method performance criteria were met for the reported samples.

Sample Performance. The spike reference sample had the 2-fluorophenol surrogate recovery below the lower quality control limit of 21% at 6%. The matrix spike duplicate performed on this sample had all acid surrogate recoveries less than 10%. There was insufficient sample to perform a re-extraction. These low recoveries may indicate a negative bias for certain acid extractable analytes that may be isolated to these extracts. The matrix spike performed on this sample had all surrogate recoveries within quality control limits. Since the reference sample and these QC samples were performed on another client's sample data usability should not be impacted.

The initial extract of MW-04 had the 2-fluorophenol (4%) and 2,4,6-tribromophenol (7%) surrogate recoveries below the lower quality control limits of 21% and 10%, respectively. These low recoveries may indicate a negative bias for certain acid extractable analytes in this extract. The re-extract of this sample had all acid surrogate recoveries within quality control limits, but the terphenyl-d14 surrogate recovery was below the lower quality control limit of 33% at 24%. This

EA Laboratories
ANALYTICAL NARRATIVE

Client: Chambers USA
Site: Tontitown Landfill
Project number: 70110.01

EA Laboratories Report: 960424
Laboratory Project Manager: R. Thomas Randall
Report Date: 3 May 1996

low recovery may indicate a negative bias for some base/neutral extractable compounds.

The initial extract of MW-01 had the terphenyl-d14 surrogate recovery below the lower quality control limit of 33% at 26%. This low recovery may indicate a negative bias for some base/neutral extractable compounds in this extract. The re-extract of this sample also had a terphenyl-d14 surrogate recovery of 26%. This low recovery may indicate a negative bias for some base/neutral extractable compounds that may be due to matrix interferences.

The re-extract of MW-07 had the terphenyl-d14 surrogate recovery slightly below the lower quality control limit of 33% at 31%. This low recovery may indicate a slight negative bias for some base/neutral extractable compounds in this extract. The initial extract of this sample had all surrogate recoveries within quality control limits (the terphenyl-d14 recovery was 33%).

The acid extractable analytes in the matrix spike duplicate had spike recoveries near or below the lower quality control limits, and all RPDs for these analytes were above the quality control limits. These recoveries indicate a negative bias for acid extractable analytes that is isolated to the matrix spike duplicate QC sample. The high RPDs are indicative of a precision deficit.

Internal standard areas in the following were below the lower laboratory quality control limit of 50% of the daily calibration standard: SITE 4 LEACH (1,4-dichlorobenzene-d4, chrysene-d12, perylene-d12), CLASS 4 LEACH (perylene-d12), and CLASS 4 LEACH SPK (chrysene-d12, perylene-d12). These internal standard areas were not so low as to impact the laboratory's ability to detect target analytes at the required reporting limits, and no target analytes which may have been quantitated using these internal standard were detected in these samples; therefore, data usability should not be impacted.

All other quality control criteria were met for the reported samples.

CHLORINATED PESTICIDES by GC - SOIL (EA9603768 - EA9603772)

Sample Chronology: The samples were extracted by SW-846 method 3520 on 4 April 1996, florisol cleaned by SW-846 method 3620 on 5 April 1996, and sulfur cleaned by SW-846 method 3660 on 9 April 1996. The sample extracts and the associated quality control samples were analyzed by SW-846 method 8080 on 24 April 1996 for the organochlorine pesticides on the Appendix II analyte list. The samples were extracted and analyzed within method specified holding times. The matrix spike and matrix spike duplicate associated with this extraction batch were performed on another client's sample. Data and results for the reference field sample, the matrix spike, and the matrix spike duplicate have been included in this report.

All sample surrogate recoveries were within the QC limits indicating acceptable sample analysis; however, because the method blank yielded low tetrachloro-m-xylene (TCX) surrogate

EA Laboratories
ANALYTICAL NARRATIVE

Client: **Chambers USA**

EA Laboratories Report: **960424**
Laboratory Project Manager: **R. Thomas Randall**
Report Date: **3 May 1996**

recoveries, and because the laboratory control sample (LCS) yielded low recoveries for aldrin and heptachlor the corrective action for failed laboratory QC dictated that the samples be re-extracted.

Field sample MW-04 could not be re-extracted due to insufficient sample; therefore, only the data and results from the initial analysis have been submitted.

The other samples were re-extracted on 25 April 1996 by SW-846 method 3520 and were analyzed by SW-846 method 8080 on 27 April 1996. The re-extraction was performed in excess of the method prescribed holding time, thus both sets of data are included. No matrix spike or matrix spike duplicate was extracted with this re-extraction batch due to insufficient sample volume. However, a duplicate laboratory control sample was extracted and analyzed with these samples.

Laboratory Method Performance: In the initial extract analysis, the laboratory method blank yielded unacceptable recoveries for TCX on both the Rtx5 and Rtx35 columns at 19 and 18%, respectively (lower QC limit 30%). Recoveries for the decachlorobiphenyl (DCB) surrogate were within QC limits on both columns. Analysis of the associated laboratory control sample yielded low recoveries for aldrin at 24% (limit 25%), and heptachlor at 10% (limit also 25%). These low recoveries may be indicative of a measurement bias for these analytes. None of the surrogate recoveries in the samples were observed outside of the QC limit windows, and no target analytes were detected in any of the samples.

The re-extracted data indicated no recovery problems in the laboratory blanks or in the first of the two LCSs, however the second, or duplicate LCS, yielded a 39% recovery for 4,4'DDT which is below the lower QC limit of 69%. The low recovery may be indicative of a measurement bias for that analyte, however no target analytes were detected in either the original or re-extracted analyses of the samples.

All other laboratory method performance criteria were met for the reported samples.

Sample Performance: The decachlorobiphenyl (DCB) surrogate recoveries on the RTX-5 column in the spike reference sample (17%), the matrix spike (13%), and the matrix spike duplicate (12%) were below the lower advisory quality control limit of 30%. These low recoveries may indicate a negative bias that may be due matrix interference. However, since all surrogate recoveries in the reported samples were within QC limits, data usability should not be impacted.

The matrix spike and matrix spike duplicate recoveries for gamma-BHC (49% and 53%), heptachlor (16% and 20%), aldrin (18% and 24%), and 4,4'DDT (11% and 26%) were below the lower method quality control limits of 56%, 40%, 40%, and 38%, respectively. These recoveries may indicate a negative bias for these analytes. The relative percent differences (RPDs) between the matrix spike and matrix spike duplicate recoveries were within QC limits except for aldrin at

EA Laboratories
ANALYTICAL NARRATIVE

Client: **Chambers USA**
Site: **Tontitown Landfill**
Project number: **70110.01**

EA Laboratories Report: **960424**
Laboratory Project Manager: **R. Thomas Randall**
Report Date: **3 May 1996**

29% (limit 22%) and 4,4'DDT at 81% (limit 27%). These high RPDs may indicate a precision deficit that may be due, at least in part, to the non-homogeneity of the sample matrix. Due to the prevailing poor blank and control sample results, the samples were restricted and reanalyzed.

Both the initial extraction and the re-extraction analyses yielded acceptable sample recoveries.

All other quality control criteria were met for the reported samples.

HERBICIDES - WATER (EA9603768 - EA9603772)

Sample Chronology: Five samples were extracted on 4 April 1996 by USEPA SW-846, Method 8150 and were analyzed for the Appendix II herbicides by the same method on 19 and 20 April 1996. All method specified holding times were met.

The batch matrix spike and matrix spike duplicate were analyzed on another Tontitown sample (TRANS STA LEACH).

Laboratory Method Performance: All laboratory method performance criteria were met for the reported samples.

Sample Performance: The recovery of the surrogate dichlorophenylacetic acid (DCAA) in the associated MSD (48%) was slightly below the lower QC limit of 50%. However, surrogate recoveries of all site specific samples were within QC limits and the low recovery of the MSD should have no impact on data usability.

The relative percent differences (RPDs) between the MS and the MSD for 2,4-D (42%) and 2,4,5-TP (33%) were above the QC limit of 25%. These high RPDs may be indicative of a precision deficit. However, because all individual recoveries were within QC limits and no analytes were detected in the samples, data usability should not be impacted.

All other quality control criteria were met for the reported samples.

METALS -WATER (EA9603768-EA9603772)

Sample Chronology: Five samples were prepared on 15 April 1996 and analyzed for total metals according to EPA SW846 methods 6010/7060/7421/7740/7841/7470 on 16-23 April 1996.

Laboratory Method Performance All laboratory method performance criteria were met for the reported sample

Sample Performance: All quality control criteria were met for the reported sample.

CERTIFICATION OF RESULTS

The Laboratory certifies that this report meets the project requirements for analytical data as stated in the Analytical Task Order (ATO) and the chain-of-custody. In addition, the Laboratory certifies that the data as reported meet the Data Quality Objectives for precision, accuracy, and completeness specified for this project or as stated in EA Laboratories Quality Assurance program for other than the conditions detailed above. Release of the data contained in this report has been authorized by the appropriate Laboratory Manager as verified by the following signature.

TABLE 2. ORGANIC ANALYSIS DATA QUALIFIERS

| | |
|---------|---|
| ND or U | <p>Indicates a compound on the target compound list (TCL) was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and, if a soil sample, for percent moisture. For example, 10 U is used for phenol in water if the sample final volume is the protocol-specified final volume. If a 1-to-10 dilution of the extract was necessary, the reported limit is (10 x 10 U) or 100 U. For a soil sample, the value is also adjusted for percent moisture. For example, if the sample had 24% moisture and a 1-to-10 dilution factor, the soil sample quantitation limit for phenol (330 U) would be corrected as follows:</p> <p>Reported limit = (330 U) x df / D</p> <p>where: df = dilution factor = 10 D = (100 - % moisture) / 100 (At 24% moisture, D = (100-24) / 100 = 0.76) Reported limit = (330 U) x 10 / 0.76 = 4300 U (rounded to two significant figures)</p> <p>For soil samples subjected to gel permeation chromatography (GPC) cleanup procedures, the contract required quantitation limit (CRQL) is also multiplied by 2 to account for the fact that only half of the extract is recovered. Note: If GPC procedures are employed, the factor of 2 is not included in the dilution factor reported; a "Y" is entered for GPC (Y/N).</p> |
| TR or J | <p>Indicates an estimated value. This flag is used under the following circumstances: 1) when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, 2) when the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL but greater than zero, 3) when the retention time data indicate the presence of a compound that meets the pesticide/Aroclor identification criteria and the result is less than the CRQL but greater than zero. Note: the "J" code is not used and the compound is not reported as being identified for pesticide/Aroclor results less than the CRQL, if the technical judgement of the pesticide residue analysis expert determines that the peaks used for compound identification resulted from instrument noise or other interferences (column bleed, solvent contamination, etc.). For example, if the sample quantitation limit is 10 ug/L, but a concentration of 3 ug/L is calculated, report it as 3 J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.</p> |
| C | <p>This flag applies to pesticide results where the identification has been confirmed by GC/MS. Single component pesticides with concentration equal to or greater than 10 ng/uL in the final extract must be confirmed by GC/MS.</p> |
| B | <p>This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified TCL compound.</p> |
| E | <p>This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. This flag does not apply to pesticides/PCBs analyzed by GC/EC methods. If one or more compounds have a response greater than full scale, the sample or extract must be diluted and reanalyzed according to the specifications listed in the SOW. All such compounds with a response greater than full scale should have a concentration flagged with an "E" on Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses are reported on separate Forms I. The Form I for the diluted sample will have the "DL" suffix appended to the sample number. NOTE: For total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak is considered separately; e.g., a diluted analysis is not required for total xylenes unless the concentration of either peak separately exceeds 200 ug/L.</p> |
| D | <p>This flag identifies all compounds identified in the analysis at a secondary dilution factor. If a sample or extract is reanalyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag.</p> |
| A | <p>This flag indicates that a TIC is a suspected aldol-condensation product.</p> |
| X | <p>Other specific flags may be required to properly define the results. If used, they are fully described and such description attached to the Sample Data Summary Package and the Case Narrative. The flags begin by using "X". If more than one flag is required, "Y" and "Z" are used, as needed. For instance, the "X" flag might combine the "A", "B", and "D" flags for some sample.</p> |
| N | <p>Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds, where the identification is based on a mass spectral library search. It is applied to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the N code is not used.</p> |
| P | <p>This flag is used for GC analyses when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a "P".</p> |

6. HERBICIDE DATA

A. QC Summary

LCS
HERBICIDES LCS RECOVERIES

Lab Name: EA LABORATORIES Contract: _____
 Lab Code: EAENG Date Extracted: 04/04/96
 EA Sample ID: HLCS3768 Date Analyzed: 04/19/96
 Client: _____ Instrument ID: SU1
 Analyst: GMG Spike Sol. #: S-6219

| COMPOUND | SPIKE ADDED (ug/L) | LCS CONCENTRATION (ug/L) | LCS RECOVERY % | # | QC LIMITS REC. |
|----------|--------------------------|--------------------------------|----------------------|---|----------------------|
| 2,4-D | 20 | 14 | 68% | | 19-113 |
| 2,4,5-TP | 4.0 | 2.9 | 73% | | 38-129 |

Column to be used to flag recovery values with an asterisk.
 * Values outside of QC limits.
