B-1S-5	18.5	7.88	770	2.17	251.4	Not enough sample		605	4313	2.25
B-1S-6	25	8.72	183	2.15	99.8	0.3	2.1	0	101871	0.29
B-1S-1 duplicate	0.5					17	5.5	284	1557	1.92

All core samples were dried at 60 °C and ground to pass through a 2mm sieve, any material that would not crush (mortar and pestle) to pass the 2mm screen was discarded.

† Measurement conducted on a solid:water ratio of 1:2 with a JKEM pH robot, using an equilibration time of 15 minutes and sample is stirred while reading. Following the method detailed by Sikora, F.J., and D.E. Kissel. 2014. Soil pH. In: F.J. Sikora and K.P. Moore, editors, Soil test methods from the southeastern United States. Southern Coop. Ser. Bull. 419. p. 48-53. Available at <http://www.clemson.edu/sera6/MethodsManualFinalSERA6.pdf>.

‡ Measurement conducted on a solid:water ratio of 1:2, using an equilibration time of 15 minutes. Following the soluble salts method detailed by Wang, J.J., T. Provin, and H. Zhang. 2014. Measurement of soil salinity and sodicity. In: F.J. Sikora and K.P. Moore, editors, Soil test methods from the southeastern United States. Southern Coop. Ser. Bull. 419. P.185-193. Available at <http://www.clemson.edu/sera6/MethodsManualFinalSERA6.pdf>.

¶ Loss on ignition is equivalent to organic matter. Soil dried for 2 hours at 120°C. Following the method detailed by Zhang, H., and J.J. Wang. 2014. Loss on ignition method. In: F.J. Sikora and K.P. Moore, editors, Soil test methods from the southeastern United States. Southern Coop. Ser. Bull. 419. p.155-157. Available at <http://www.clemson.edu/sera6/MethodsManualFinalSERA6.pdf>. Total N and C are determined by combustion on an Elementar VarioMax CM.

§ Method used for ammonium-nitrogen: 5g soil/15ml 2N KCl, shake for 15 minutes, filtered through Whatman 4 paper; analyzed on a Skalar autoanalyzer using a modified Berthelot reaction. Ammonia is chlorinated to monochloramine which reacts with salicylate to 5-aminosalicylate. After oxidation and oxidative coupling a green complex is formed. The absorption of the formed complex is measured at 660nm. Method used for nitrate-nitrogen plus nitrite-nitrogen, same KCl extraction as for ammonium-N, also analyzed on the Skalar using a method based on the cadmium reduction method. The sample is passed through a column containing granulated copper-cadmium to reduce the nitrate to nitrite. The nitrite (originally present plus reduced nitrate) is determined by diazotizing with sulfanilamide and coupling with a-naphthylenediamine dihydrochloride to form a highly colored azo dye which is measured at 540nm.

Table 3. Total elemental composition of core samples taken from the bore hole drilling at C&H Farm, using the EPA305b digest method. Analyses were determined by the Division of Agriculture University of Arkansas System Soil Testing and Research Laboratory, Fayetteville, AR. †

† All core samples were dried at 60 °C and ground to pass through a 2mm sieve, any material that would not crush (mortar and pestle) to pass the 2mm screen was discarded. All analyses used subsamples from the ground material. Laboratory QA/QC includes among other standard protocols, that with every set of samples digested, a blank and a certified soil from North American Proficiency Test Program (<http://www.naptprogram.org/>) is included as a check, along with at least one sample in duplicate. If the check is out of bounds by more than 2.5 time the Mean Absolute Deviation value, the sample is digested again and rerun. The digest and duplicate for this set of core samples all met this criteria.

Table 4. Mehlich-3 extractable elemental composition of core samples taken from the bore hole drilling at C&H Farm. Analyses were determined by the Division of Agriculture University of Arkansas System Soil Testing and Research Laboratory, Fayetteville, AR. †
